It expired by limitation in two years. The sedition law was a stringent act against seditious conspiracy and libel, chiefly aimed at obstructive opposition to the proceedings of government and libelous or seditious publications in regard to them. These laws had little effect besides that of overthrowing the Federal party, which was held responsible for them.

In its simplest form it is merely the cavity of a two-layered germ, or gastrula, lined with hypoblastic cells — a mere sac, the mouth and anus being one. With increasing complexity of structure, and especially by the formation of an outlet (anus) distinct from the inlet (mouth), the alimentary canal assumes more definitely the character of a special gastric or digestive cavity, which may remain in open communication with a general body-cavity, or become shut off therefrom as an intestinal tube. The latter is its character in all the higher animals, in which, moreover, the canal acquires various specializations, as into gullet, stomach, intestine, etc., becomes variously complicated or convoluted, has special ramifications and annexes, etc. In those animals which develop an umbilical vesicle, or this and an amnion and allantois, the cavity of the alimentary canal is primitively continuous with that of the vesicle and with the allantoic cavity. — **Alimentary debt**, in *Scots law*, a debt incurred for necessaries or maintenance. — **Alimentary fund**, in *Scots law*, a fund set apart by the direction of the giver for an aliment to the receiver. > *Shak.*, All's Well, iii. 2.

When joined to nouns accompanied by a definitive (the definite article, a possessive or demonstrative pronoun, etc.), *all* precedes the latter whether with a singular or plural noun, or else follows the noun if it is plural; as, *all* my labor; *all* his goods; *all* this time; *all* these things; *all* the men agreed to this, or, the men *all* agreed to this. In the phrases *all* day, *all* night, *all* summer, *all* winter, *all* the year, *all* the time, etc., the noun is an adverbial accusative. In the first four the article is usually omitted.

The alternative construction is *all of us, all of them*, etc. (see II., 2); or the two constructions may stand together.

> *We all of us* complain of the shortness of time.
> *Addison*, Spectator, No. 93.

The adjective *all*, with a singular or plural noun, is often separated from its subject, especially by the verb *be* (expressed, or in the present participle often omitted), and, being thus apparently a part of the predicate, assumes a transitional position, and may equally well be regarded as an adverb, meaning altogether, wholly: as, the house was *all* dark; he was *all* ears; the poor horse was *all* skin and bones; the papers were *all* in confusion; it was *all* a mistake; it is *all* gone.

> He is *all* for fasting. *Burton*, Anat. of Mel., p. 245.

allantois (a-lan′tō-is), *n.* [NL., shorter form (appar. as sing. of assumed pl.) of *allantoides*: see *allantoid*.] A fetal appendage of most vertebrates, developing as a sac or diverticulum from the posterior portion of the intestinal cavity. It is one of the organs of the embryo of all amniotic vertebrates, or those which develop an amnion, but is wanting or is at most rudimentary in amphibians and fishes. In birds and reptiles it is large and performs a respiratory function, and in mammals contributes to form the umbilical cord and placenta. Its exterior primitively consists of mesoblast, its cavity receiving the secretion of the primordial kidneys (Wolffian bodies). So much of the sac as remains pervious within the body of the embryo becomes the urinary bladder, or, in some degree, a urinary passage. The umbilical arteries and veins course along the elongated stalk of the sac, which becomes the umbilical cord, and that part of these allantoic vessels within the body which does not remain pervious becomes the urachus and round ligament of the liver. The expanded extremity of the allantois, in most mammals, unites with the chorion to form the placenta. In those vertebrates, as mammals, in which the umbilical vesicle has but a brief period of activity, the allantois chiefly sustains the functions whereby the fetus is nourished by the blood of the mother, and has its own blood arterialized. In parturition, so much of the allantois as is outside the body of the fetus is cast off, the separation taking place at the navel. See cut under *amnion*.

The mod. F. *allégeance* in this sense is from the E. word.] **1.** The tie or obligation of a subject or citizen to his sovereign or government; the duty of fidelity to a king, government, or state. Every citizen owes allegiance to the government under which he is born. *Natural* or *implied allegiance* is that obligation which one owes to the nation of which he is a natural-born citizen or subject so long as he remains such, and it does not arise from any express promise. *Express allegiance* is that obligation which proceeds from an express promise or oath of fidelity. *Local* or *temporary allegiance* is due from an alien to the government or state under or in which he resides. In the United States the paramount allegiance of a citizen has been decided to be due to the general government, and not to the government of the particular State in which he is domiciled.

Fealty is the bond that ties any man to another to whom he undertakes to be faithful; the bond is created by the undertaking and embodied in the oath. Homage is the form that binds the vassal to the lord, whose man he becomes, and of whom he holds the land for which he performs the ceremony on his knees and with his hands in his lord's hands. *Allegiance* is the duty which each man of the nation owes to the head of the nation, whether the man be a land-owner or landless, the vassal of a mesne lord or a lordless man; and *allegiance* is a legal duty to the king, the state, or the nation, whether it be embodied in an oath or not. But although thus distinct in origin, the three obligations had come in the middle ages to have, as regards the king, one effect. *Stubbs*, Const. Hist., § 785.

The conquest of the Danelaw was followed by the earliest instances of those oaths of *allegiance* which mark the substitution of a personal dependence on the king as lord for the older relation of the freeman to the king of his race. *J. R. Green*, Conq. of Eng., v.

Hence—**2.** Observance of obligation in general; fidelity to any person or thing; devotion.

Fond shouts and salutations from their mouths,
Even in the presence of the crowned king.
Shak., 1 Hen. IV., iii. 2.

Love, all the faith and all the *allegiance* then.
Pope, Essay on Man, iii. 235.

=**Syn.** *Allegiance*, *Loyalty*, *Fealty*. *Allegiance* is the most formal and official of these words; it is a matter of principle, and applies especially to conduct; the *oath of allegiance* covers conduct only. *Loyalty* is a matter of both principle and sentiment, conduct and feeling; it implies enthusiasm and devotion, and hence is most frequently chosen for figurative uses: as, *loyalty* to a lover, husband, family, clan, friends, old traditions, religion. Neither *allegiance* nor *loyalty* is confined to its original meaning of the obligation due from a subject to a prince. *Fealty* has escaped less completely from this earliest sense, but has a permissible use in the sense of fidelity under obligation of various kinds.

Our people quarrel with obedience;
Swearing *allegiance*, and the love of soul,
To stranger blood, to foreign royalty.
Shak., K. John, v. 1.

The first four words have been used without distinction to express the union or coöperation of two or more persons, organizations, or states. *Alliance* is the most general term. Often a *confederacy* and sometimes a *league* between states means a closer union than an *alliance*. *Alliance* is rarely used of a combination for evil; but the other words are often so used, *confederacy* having specifically such a meaning in law. *Alliance* alone is used of the union of families by marriage. *Coalition* is often used of the temporary coöperation of persons, parties, or states that are ordinarily opposed.

Alliances, at once offensive and defensive, have one of the usual and more important characteristics of confederations. *Woolsey*, Introd. to Inter. Law, § 103.

We must resolve to incorporate into our plan those ingredients which may be considered as forming the characteristic difference between a *league* and a government; we must extend the authority of the union to the persons of the citizens—the only proper objects of government. *A. The *coalitions* of nearly all Europe, which resisted and finally humbled the Grand Monarch, are among the most righteous examples of measures for preserving the balance of power which history records. *Woolsey*, Introd. to Inter. Law, § 44.

The alligators differ from the true crocodiles in having a shorter and flatter head, cavities or pits in the upper jaw, into which the long teeth of the under jaw fit, and feet much less webbed. Their habits are less aquatic. They frequent swamps and marshes, and may be seen basking on the dry ground during the day in the heat of the sun. They are most active during the night. The largest of them attain the length of 17 or 18 feet. They live on fish, and sometimes catch hogs on the shore, or dogs which are swimming. In winter they burrow in the mud of swamps and marshes, lying torpid till spring. The female lays a great number of eggs, which are deposited in the sand, and left to be hatched by the heat of the sun. The alligator is found on the coast from North Carolina to the Rio Grande. *A. sinensis* occurs in China. Among

alligatorid (al″i-gā-tor'id), *n.* One of the *Alligatoridæ*.

Alligatoridæ (al″i-gā-tor'i-dē), *n. pl.* [NL., < *Alligator* + *-idæ*.] A family of saurian reptiles, of the order *Crocodilia*, related to the family *Crocodilidæ*, and with some authors forming only a subfamily (*Alligatorinæ*) of the latter; by most naturalists now judged to be distinct. The typical genus of the family is *Alligator*; other genera are *Caiman* and *Jacare* (which see). According to Huxley's

analysis, the *Alligatoridæ* have the head short and broad; the teeth very unequal, the first and fourth of the under jaw biting into pits in the upper jaw; the premaxillo-maxillary suture straight or convex forward; the mandibular symphysis not extending beyond the fifth tooth, the splenial element not entering into it; and the cervical scutes distinct from the tergal. The *Crocodilidæ* have the head longer; the teeth unequal; the first mandibular tooth biting into a fossa, the fourth into a groove, at the side of the upper jaw; the premaxillo-maxillary suture straight or convex backward; the mandibular symphysis not extending beyond the eighth tooth, and not involving the splenial elements; the cervical scutes sometimes distinct from the tergal, sometimes united with them. Most living *Alligatoridæ* are confined to America. The *Crocodilidæ* were supposed to be confined to the old world until the discovery of a true crocodile in America. In general appearance and economy the members of the two families are sufficiently similar to be confounded in popular language. Both families belong to the section of the order *Crocodilia* in which the nasal bones enter into the formation of the narial aperture, the contrary being the case in the section which includes the Gangetic crocodile or gavial, *Gavialis gangeticus*.

2. A similar fresh-water turtle, *Macrochelys lacertina*, of the family *Chelydridæ*, with very long tail and neck. ★**alliterate** (a-lit'e-rāt), *n.* [< *alliterate*, *v.*, in allusion to *literate*, *n.*] One given to the use of alliteration. [Rare.]

Even the stereotyped similes of these fortunate *alliterates* [poets before Chaucer], like "weary as water in a weir" or "glad as grass is of the rain," are new, like nature, at the thousandth repetition. *Lowell*, Study Windows, p. 257.

Apt *alliteration's* artful aid.
Churchill, Prophecy of Famine, l. 233.

Verse in which *alliteration* is essential, and other rime ornamental, is the prevailing form in Anglo-Saxon, Icelandic, Old Saxon. Specimens are found in Old High German. *Alliteration* in these languages even ran into prose. *F. A. March*, A.-S. Gram., § 506.

Though the word *alliteration* seems to have been invented by Pontanus in the fifteenth century, the Romans were certainly aware that the device was in use among themselves. *Trans. Amer. Philol. Ass.*, XV. 59.

Alliteration was a characteristic of old Teutonic poetry (Anglo-Saxon and Middle English, Old Saxon, Icelandic, etc.), terminal rime, as a regular feature, being of later (Romance) introduction. The lines were divided into two sections, the first having regularly two alliterating syllables, the second one; but by license or mere accident four or more alliterating syllables might occur, as in the last line of the extract from Piers Plowman. The alliterating syllable was always accented, and was not necessarily initial, as written; it might follow an unaccented prefix, as *ar-raye* in the extract. The vowels, being all

more or less open and easy of utterance, might alliterate with one another. In Churchill's line "Apt alliteration's artful aid," given above, the initial vowel-sounds are different (a, a or ạ, ä, ā), though spelled with the same letter. The following is an example of Middle English alliteration:

Hire robe was ful riche of red scarlet engreyned,
With ribanes of red gold and of riche stones;
Hire arraye me ravysshed such richesse saw I nevere;
I had wondre what she was and whas wyf she were.
Piers Plowman (B), ii. 15.

Chaucer's verse is cast on the Romance model with final rime, but he often uses alliteration as an additional ornament:

Ther schyveren schaftes upon scheeldes thykke;
He feeleth thurgh the herte-spon the prikke.
Up springen speres twenty foot on highte;
Out goon the swerdes as the silver brighte.
The helmes to-hewen and to-schrede
Out brest the blood, with sterne stremes reede,
With mighty maces the bones thay to-brest,
He thurgh the thikkeste of the throng gan threst (etc.).
Chaucer, Knight's Tale, l. 1747.

Such alliteration is much affected by Spenser and his imitators, and occurs with more or less frequency in all modern poetry.

alliterative (a-lit'ę-rā-tiv), *a.* [< *alliterate* + *-ive.*] Pertaining to or consisting in alliteration; characterized by alliteration.

A few verses, like the pleasantly *alliterative* one in which he [Dryden] makes the spider, "from the silent ambush of his den," "feel far off the trembling of his thread," show that he was beginning to study the niceties of verse. *Lowell*, Among my Books, 1st ser., p. 40.

To *tolerate* is to bear with something unpleasant: as, I would not *tolerate* such impertinence. Many things are *tolerated*, or *suffered*, or even *allowed*, that are not *permitted*, and many are *permitted* that are not really *consented to*, much less *sanctioned*.

When treated with alkalis it produces alloxanic acid. When we wish to *alloy* three or more metals, we often experience difficulties, either because one of the metals is more oxidisable, or denser, or more fusible than the others, or because there is no direct affinity between two of the metals. *Ure*, Dict., I. 92.

2. To reduce to a desired standard or quality by mixing with a less valuable metal: as, to *alloy* gold or silver with copper.—**3.** Figuratively, to debase or reduce in character or condition by

The alloys are numerous, as the brasses, bronzes, solders, type-, gun-, and bell-metals, etc., and are of great importance in the practical arts. There are many varieties of these alloys, the character of each being determined by the proportions of its constituents. An artificial metallic mixture containing quicksilver is termed an *amalgam* (which see).

2. An inferior metal mixed with one of greater value. The gold and silver coins of the United States are of the standard fineness of 900 parts of fine metal and 100 parts of copper alloy, of which in the case of gold not more than one tenth may be silver. In the case of silver coins the alloy is wholly of copper. Hence these coins are said to be 900 fine. See *alloyage*.

The British standard for gold coin is 22 parts pure gold and 2 parts *alloy*, and for silver, 222 parts pure silver to 18 parts of *alloy*. *Ure*, Dict., I. 96.

alloyage (a-loi′āj), *n.* [< *alloy* + *-age.*] The practice or process of alloying metals; specifically, in *minting*, the practice of adding to the precious metals a small proportion of a baser one, to harden them, with the object of producing a clear impression when the coins are struck, and of preventing or lessening abrasion while they are in circulation. See *alloy*, *n.*, 2.

alloy-balance (a-loi′bal″ans), *n.* A balance for weighing metals which are to be combined in decimal proportions. In Robert's alloy-balance the point of suspension is movable, and is adjusted to the point at which the arms of the balance bear to one another the proportion of the metals to be weighed, as for example 17 per cent. of tin to 83 of copper. The beam of the balance is then brought to the position of equilibrium by means of a weight suspended from a continuation of the short arm of the balance; and when the balance is so adjusted any quantity of copper put in the short-arm scale will be balanced by the requisite proportion of tin in the other scale, that is, in the supposed case, 17 per cent. of the total weight of the two.

The tree is cultivated for its nuts in the region bordering the Mediterranean, in California, and to a limited extent in the southern United States; elsewhere it is grown for ornament, on account of its large early flowers. almoner[1], **almner** (al′mon-ėr, äm′nėr), *n.* [Early mod. E. *almoner, almener, almner, amener, amner*, < ME. *amoner, amener*, earlier *aumoner, aumener, awmener*, etc., < OF. *aumoner, aumonier, almosnier*, mod. F. *aumônier* = Pr. *almosnier, almonier* (ML. reflex *almonarius, *almosinarius*) = Sp. *limosnero*, almoner, = Pg. *esmoler*, almoner, *esmoleiro*, a begging friar, = It. *limosiniero, -iere, -ario*, < ML. *eleemosynarius*, a giver or distributer, sometimes also a receiver, of alms (cf. The office of almoner was first instituted in monasteries and other religious houses, which were required to dispense part of their revenues in charity. Almoners, usually priests, and often acting also as chaplains, were afterward attached to the households of sovereigns, feudal lords, prelates, etc., and to public institutions of various kinds. In France the name early became synonymous with *chaplain*. (See *aumonier*.) The *grand almoner* of the realm was regularly a cardinal or other high prelate; since the Revolution this post has been alternately restored and abolished. In England there is a *lord almoner*, or *lord high almoner*, an ecclesiastical officer, generally a bishop, who formerly had the forfeiture of all deodands and the goods of all suicides, which he had to distribute to the poor. He now distributes twice a year the sovereign's bounty, which consists in giving a silver penny each to as many poor persons as the sovereign is years of age. There is also a *sub-almoner*, and a hereditary *grand almoner*. The office of the latter is now almost a sinecure.

ridian, and the time of rising of a star over the wires is noted; the telescope is then pointed to west of the meridian, and the time of descending of a star is noted. In this way, if the positions of the stars are known, the correction of a timepiece and the latitude may be determined; on the other hand, if these are known, either the right ascensions or the declinations of the stars may be determined. The instrument is of great value on account of its having fewer instrumental errors than a meridian circle.

Among the Mohammedans the aloe is a symbolic plant, especially in Egypt, and every one who returns from a pilgrimage to Mecca hangs it over his street-door, as a token that he has performed the journey. In Africa the leaves of some species of aloe are made into ropes, fishing-lines, bow-strings, and hammocks. Several species yield aloes, the well-known bitter purgative medicine. The *American aloe* is the century-plant, *Agave Americana,* and the *false aloe* is *A. Virginica.* See *Agave.* Many species are cultivated for ornament, growing readily on very dry soil. aloes (al′ōz), *n. sing.* or *pl.* (pl. of *aloe,* used also as sing.). [See *aloe.*] **1.** A drug, the inspissated juice of several species of aloe. It is obtained from the leaves, sometimes by cutting them across, when the resinous juice exudes and is evaporated into a firm consistence, sometimes by pressing the juice and mucilage out together, and in other cases by dissolving the juice out of the cut leaves by boiling and then evaporating to a proper consistency. Several kinds are known in commerce. Socotrine aloes, also called East Indian or Zanzibar aloes, the produce mainly of varieties of *A. Perryi,* comes chiefly from Red Sea ports and Aden. Barbados and Curaçoa aloes are produced in the West Indies from *A. vera,* which has been introduced from the Mediterranean. Cape and Natal aloes are obtained probably from *A. ferox,* and form by far the greater part of the supply. The name *hepatic aloes* is applied to any opaque and liver-colored variety of the drug. The extract of aloes when treated with nitric acid gives rise to various yellow and brown products, which by the aid of mordants can be fixed to silk and wool; but they are seldom used in dyeing.

F. B. Morse), in *teleg.*, a system of symbols, consisting of dashes and dots, to be used in telegraphic messages where Morse's self-recording instrument, called the indicator, is employed. (See *indicator*.) The dash and dot are combined indifferent ways to indicate the different letters: thus, one dot (.) means E; a dash (—), T; a dot and a dash (.—), A; a dash and three dots (—...), B; etc. The same system can be used with instruments employing a magnetic needle (see *telegraph*), a right-hand deflection of the needle corresponding to a dash and a left-hand to a dot. The *Continental alphabet*, which is used in Europe, differs from the Morse in the formation of several letters. Military signaling is often effected on the same principle by long or short wavings of a flag, or by sun-flashes by means of a heliostat, etc., the long meaning a dash and the short a dot.

The earliest altars were turf mounds, large flat-topped stones, or other rude elevations, natural or artificial; but when temples came to be built altars were generally made of hewn stone, marble, or metal, and became more and more ornate. Greek and Roman altars were round, triangular, or square in plan, often elaborately adorned with sculpture, and bearing inscriptions. Sometimes, as at Pergamon, the altar was a structure of vast size and complex plan, and was in itself an art monument of the highest importance. In the Jewish worship two altars were used: the altar of burnt-offering, which stood at the entrance to the tabernacle, and afterward occupied a corresponding position in the temple, and the altar of incense, which stood in the holy place. Both were made of shittim-wood, the former being overlaid with brass, the latter with gold.

2. In most Christian churches, the communion-table. In the primitive church it was of wood, subsequently of stone, marble, or bronze, sometimes with rich architectural ornaments, sculptures, and painting. In the Roman Catholic Church the altar is the table, since the early ages of the church either of stone or including a block of stone (the altar-stone), upon which the priest consecrates the eucharist. The altar-stone is consecrated by the bishop or a specially licensed abbot, who anoints it with chrism, and often seals up certain relics in a small cavity made for the purpose; the consecration remains in virtue until either the stone or the seal is broken.

Lesser or *side altars* often stand in chapels or against the pillars of the nave. See cut under *cathedral*. —**Privileged altar**, in the *Rom. Cath. Butler*, Coptic Churches, II. i. 3–5.

altar-bread (âl'tăr-bred), *n.* Bread prepared for the eucharist. Unleavened bread is required for this purpose in the Roman Catholic Church, and is used in many Anglican churches, in which either leavened or unleavened bread is permitted. In both the latter is made into small thin disks or wafers, called severally *altar-breads*, usually stamped with some emblem, as the cross or crucifix, or I. H. S. In the former church, after consecration, the altar-bread is called *host* (see *host*), and the wafers are of two sizes, the larger for the priest, the smaller for the people. The Greek Church uses leavened bread especially made for the purpose. See *oblate*, *n.*, 1.

altar-table (âl'tăr-tā″bl), *n.* 1. In a Christian church, the top or the consecrated portion of an altar; the altar proper, or mensa.—2. A name for one of the wooden tables which were substituted for the old altars in England in the seventeenth century, and used for the communion where the old altars had been destroyed by the Roundheads. At first this table was placed by the reformers against the eastern wall in the position of the old stone altar. This position gave umbrage to the Puritans, who held that it was characteristic of the Church of Rome. Cromwell therefore caused the altar-table to be removed to the middle of the chancel, and to be surrounded with seats for the communicants. At the restoration it was almost universally replaced in its ancient position. When used it is covered with a white linen cloth.

altropathy (al-trop′a-thi), *n.* [< L. *alter*, another, + Gr. *-πάθια*, < *πάθος*, suffering.] Feeling for others; sympathy.

Better still to convey the altruistic conception, and in more natural contrast with autopathy, there might in like manner be substituted for sympathy the allied expression *altropathy*, which, to a certain extent, would come to the aid of the stronger term philanthropy.

L. F. Ward, Dynam. Sociol., II. 371.

altruism (al′trö-izm), *n.* [< F. *altruisme*, < It. *altrui*, another, other people (= Pr. *altrui* = OF. *altrui*, F. *autrui*), prop. the objective case, sing. and pl., of *altro*, other (= OF. *altre*, F. *autre*), < L. *alter*, other: see *alter*. In the colloquial Latin of later times, *alter*, like many other pronominal words, was strengthened by the addition of *hic*, this; hence dat. **alteri-huic*, contr. to **altruic*, *altrui*, which became the common objective case.] A term first employed by the French philosopher Comte to denote the benevolent instincts and emotions in general, or action prompted by them: the opposite of *egoism*.

If we define *altruism* as being all action which, in the normal course of things, benefits others instead of benefiting self, then, from the dawn of life, *altruism* has been no less essential than egoism.

H. Spencer, Data of Ethics, § 75.

F. *alun* = MHG. *alūn*, G. *alaun* (> Pol. *alun* (barred *l*), Sloven. *alun* = Russ. *galunŭ* = Lith. *alunas*), < L. *alumen*, alum; of unknown origin.] The general name of a class of double sulphates formed by the union of aluminium, iron, chromium, or manganese sulphate with the sulphate of some other metal, commonly an alkaline metal or ammonium. Common or *potash alum* has the formula $Al_2(SO_4)_3 + K_2SO_4 + 24H_2O$. It is produced by mixing concentrated solutions of potassium sulphate and crude aluminium sulphate. The double salt at once crystallizes in octahedrons. Alum is soluble in water, has a sweetish-sour taste, reddens litmus, and is a powerful astringent. In medicine it is used internally as an astringent, externally as a styptic applied to severed blood-vessels. In the arts it is used as a mordant in dyeing, and extensively in other ways. When mixed in small amount with inferior grades of flour, it is said to whiten them in the process of bread-making, but its effect on the system is injurious.—**Alum shale**, another name for *alum slate*, including especially its more shaly varieties.—**Alum slate**, a variety of clay slate containing an easily decomposed and frequently occurring compound of sulphur and iron (marcasite). The decomposition of this substance gives rise to the production of alum, usually potash alum, which is a compound of potassium sulphate and aluminium sulphate, and which may sometimes be leached out in a commercial way.—**Basic alum**, alum treated with alkali.—**Burnt alum**, alum from which the water of crystallization has been driven off by heat. Also called *dried alum*, *alumen exsiccatum*.—**Concentrated alum**, normal aluminium sulphate, $Al_2(SO_4)_3$, which is prepared on a large scale by treating roasted clay with oil of vitriol, and crystallizing out the sulphate formed. It is largely used in dyeing. ★**alumina** (a-lū′mi-nạ), *n.* [NL., < L. *alumen* (*alumin-*): see *alum*.] The oxid of aluminium, Al_2O_3, the most abundant of the earths. In the uncombined state alumina occurs as corundum, with its varieties adamantine spar, ruby, and sapphire. In this form it is, next to the diamond, the hardest of natural substances. It is, however, usually combined with silica in nature, especially in the feldspars and the hydrated silicate of alumina, kaolin, a fine, scaly mineral, the basis of clays, loams, and most soils, and of refractory bricks, crucibles, porcelains, and hydraulic cement. Fullers' earth, a hydrated silicate of alumina, is important as a mordant in dyeing, and is also used in bleaching oils.

★**aluminium** (al-ū-min′i-um), *n.* [NL. (> F. *alumine*, > E. *alumin*), < L. *alumen* (*-min-*), alum (see *alum*), + *-ium*, as in *sodium*, *potassium*, etc.; first proposed by Davy in the form *alumium* and then *aluminum*. It was isolated by Wöhler.] Chemical symbol Al; atomic weight 26.9. A metal of silver-white color and brilliant luster, about as hard as zinc, very malleable and ductile, highly sonorous, and a good conductor of heat and electricity. Its most remarkable character is its low specific gravity (2.56), which is about one third that of iron and less than that of marble. It tarnishes but slowly in air, and even when molten does not easily oxidize. Its melting-point is lower than that of silver. Aluminium in combination with oxygen (Al_2O_3) forms the common earth alumina, which exists in nature as the mineral corundum, of which the ruby, sapphire, and emery are varieties; the hydrated sesquioxid exists as the minerals diaspore, gibbsite, and bauxite. Alumina also enters into the composition of a very large number of minerals, the most important of which are the feldspars. From the decomposition of these, clay (kaolin, etc.) is produced, which is essentially a hydrated silicate of aluminium. Among other important minerals containing aluminium are the silicates andalusite, cyanite, fibrolite, topaz, and all of the zeolites; the fluoride of aluminium and sodium, cryolite, from which the metal is reduced; the oxid of aluminium and magnesium, spinel; the sulphates aluminite, alum-stone, the alums, etc.; the phosphates turquoise, lazulite, etc.; the carbonate dawsonite, and many others. It is estimated that in its various compounds aluminium forms about one twelfth of the crust of the earth. In consequence of its very low specific gravity, freedom from tarnish, non-poisonous qualities, and ease of working, aluminium is a valuable metal. The use of aluminium has extended with the rapid decrease, through improved processes, in the cost of separating it from the combinations in which it occurs in nature. It is used especially for physical apparatus and other articles in which lightness and great strength are necessary. The cap of the Washington monument, which forms the tip of its lightning-rod, is a pyramidal mass of aluminium weighing 100 ounces. See the supplement.—**Aluminium bronze**, an alloy of 9 parts of copper with 1 of aluminium. It resembles gold in luster and color, and is used as a cheap imitation of that metal. Unlike gold, however, it gradually tarnishes on exposure to the air. It is much used in cheap jewelry and ornamental work, and also for a great variety of industrial purposes, especially for bearings in machinery.—**Aluminium silver**, a

compound formed by the addition of a small amount of silver to aluminium. It is said that 3 per cent. of silver is sufficient to give to aluminium the color and brilliancy of pure silver, over which it has the great advantage of not being tarnished by sulphureted hydrogen.—**Aluminium solder**, an alloy of gold, silver, copper, and, for soft solder, a little zinc: used in soldering aluminium bronze.

A diplomatic agent of the highest rank, employed to represent officially one prince or state at the court or to the government of another. Diplomatic agents are divided into three general classes: (1) *ambassadors*, *legates*, and *nuncios*; (2) *envoys* and *ministers plenipotentiary* (including *ministers resident*); (3) *chargés d'affaires*. Ambassadors represent the person of their sovereigns, as well as the state from which they come, and are entitled to ask an audience at any time with the chief of the state to which they are accredited; to rank next to the blood royal; to exemption from local jurisdiction for themselves and their households; to exemption from imposts and duties, immunity of person, free exercise of religious worship, etc. The United States sends and receives no ambassadors in this sense of the term, but only ministers of the second rank, who are often popularly called ambassadors. The nuncios of the pope who are not cardinals, and the *legati a latere* and *de latere*, cardinals in rank, represent the papal see in its ecclesiastical capacity mainly, and bear the rank of ambassadors. Envoys, ministers, and ministers plenipotentiary are held to represent, not the person of the sovereign, but the state from which they are sent, and they are accredited to the sovereign of the state to which they are sent. This is the ordinary class of diplomatic representatives between less important states, or between greater and smaller states. Ministers resident accredited to the sovereign enjoy a rank similar to that of envoys. Chargés d'affaires are resident agents of their governments, and are provided with credentials to the minister of foreign affairs, with which officer at the present day, however, both ambassadors and ministers have to deal almost exclusively in their official relations. See *minister*. Hence—2. In general, any diplomatic agent of high rank; an agent or a representative of another on any mission.—3. A thing sent as expressive of the sentiments of the sender.

2. A mineralized pale-yellow, sometimes reddish or brownish, resin of extinct pine-trees, occurring in beds of lignite and in alluvial soils, but found in greatest abundance on the shores of the Baltic, between Königsberg and Memel, where it is thrown up by the sea. It is a hard, translucent, brittle substance, having a specific gravity of 1.07. It is without taste or smell, except when heated; it then emits a fragrant odor. Its most remarkable quality is its capability of becoming negatively electric by friction; indeed, the word *electricity* is derived from the Greek for amber, ἤλεκτρον. It sometimes contains remains of extinct species of insects. It yields by distillation an empyreumatic oil consisting of a mixture of hydrocarbons and succinic acid. It is now used chiefly for the mouthpieces of pipes and for beads, and in the arts for amber varnish. In mineralogy it is called *succinite*. Artificial amber is for the most part colophony.

3. In the English versions of the Old Testament (Ezek. i. 4, 27; viii. 2) used to translate the Hebrew word *chashmal*, a shining metal, rendered in the Septuagint *ēlektron*, and in the Vulgate *electrum*. It softens in the heat of the hand, melts below 212° F. into a kind of yellow resin, and is highly soluble in alcohol. It is usually found floating on the surface of the ocean, or cast upon the shore in regions frequented by whales, as on the coasts of the Bahama islands, sometimes in masses of from 60 to 225 pounds in weight. The *ambiens* arises from the pelvis about the acetabulum, and passes along the inner side of the thigh; its tendon runs over the convexity of the knee to the outer side, and ends by connecting with the flexor digitorum perforatus. . . . When this arrangement obtains, the result is that when a bird goes to roost, and squats on its perch, the toes automatically clasp the perch by the strain upon the *ambiens* that ensues as soon as the leg is bent upon the thigh, and the tarsus upon the leg, the weight of the bird thus holding it fast upon its perch.

[In a starfish] a deep furrow, the *ambulacral groove*, occupies the middle of the oral surface of each ray, and is nearly filled by contractile sucker-like pedicels, . . . apparently arranged in four longitudinal series.

The twenty series of longitudinal plates are disposed in ten double series—five ambulacral and five interambulacral. . . . Each *ambulacral plate* is subdivided by a greater or less number of sutures . . . into a corresponding number of minor plates, . . . called pore plates.

See cut under *Echinoidea*.

Another marked peculiarity of the Echinoderm type is the general, if not universal, presence of a system of *ambulacral vessels*, consisting of a circular canal around the mouth, whence canals usually arise and follow the middle line of each of the ambulacral metameres.

Huxley, Anat. Invert., p. 54.

ambulacrum (am-bū-lā′krum), *n.*; pl. *ambulacra* (-krä). [NL. use of L. *ambulacrum*, a walk, alley, < *ambulare*: see *ambulate*.] In *zoöl.*, a row, series, or other set of perforations in the shell of an echinoderm, as a sea-urchin or starfish, through which are protruded and withdrawn the tube-feet or pedicels. Each such row or set of holes usually forms a narrow grooved line from base to apex of a sea-urchin, and from the center to the end of each ray of a starfish, along the oral aspect of the body. Each set or radiating series of perforations is an ambulacrum, the several rows together being the ambulacra. The usual definition of ambulacra as the perforated spaces through which the tube-feet are protruded leaves a doubt whether an ambulacrum is not one such perforated space. Ambulacra is sometimes used for the tube-feet themselves, collectively; in which case it properly signifies several sets or series of tube-feet, not several tube-feet of any single row or series.

Amen was always represented in human form, and was of a much higher order than the ram-headed divinity, the god of life, worshiped especially at the famous oracular sanctuary of the Libyan oasis of Ammon (now Siwah). The latter type was confused by the Greeks and Romans with that of Amen-Ra, and was adopted by them as Zeus-Ammon or Jupiter-Ammon, but in art was generally idealized so that only the horns, sometimes with the ears, of the ram were retained, springing from a human head.

★**ammonia** (a-mō′ni-ä), *n.* [NL. (Bergmann, 1782), < L. (*sal*) *ammoniacum:* see *ammoniac.*] **1.** The modern name of the volatile alkali, NH_3, formerly so called to distinguish it from the more fixed alkalis. It is a colorless gas, very soluble in water, having a pungent and suffocating smell, and a transient alkaline effect on vegetable colors. It can be liquefied by pressure and frozen by a mixture of solid carbonic acid and ether in a vacuum. Its density is only about half that of atmospheric air. It is a strong base, and forms a great number of salts which are isomorphous with those of potassium and exhibit a close analogy to them. It is found in minute quantity in air, and is a natural product of the decay of animal substances. It is procured artificially by the destructive distillation of nitrogenous organic matters, such as bones, hair, horns, and hoofs, and is largely obtained as a by-product in the manufacture of illuminating gas from coal. Ammonia is used very largely in medicine and the arts, chiefly in solution in water under the name of *liquid ammonia, aqueous ammonia,* or *spirits of hartshorn.* (See *aqua ammoniæ,* under *aqua.*) Among the more important salts of ammonia is ammonium chlorid, or sal ammoniac, NH_4Cl, which formerly was the source from which all ammonium salts were prepared. It is largely used in dyeing, and in soldering and tinning. At present ammonium sulphate, $(NH_4)_2SO_4$, is the starting-point for the manufacture of ammonium salts, being made in large quantity from gas-liquor. It is also used as a fertilizer. There are several ammonium carbonates. The commercial article, called *sal volatile,* is a mixture of hydrogen-ammonium carbonate and ammonium carbamate. See the supplement.

ammonium (a-mō′ni-um), *n.* [NL. (Berzelius, 1808), < *ammonia* + *-um*.] A name given to the hypothetical base (NH_4) of ammonia, analogous to a metal, as potassium. It has not been isolated. If mercury at the negative pole of a galvanic battery is placed in contact with a solution of ammonia or ammonium chlorid, and the circuit is completed, the mass swells to many times its former volume, and an amalgam is formed which, at the temperature of 70° or 80° F., is of the consistence of butter, but at the freezing-point is a firm and crystallized mass. This amalgam is supposed to be formed by the metallic base ammonium, and is the nearest approach to its isolation. On the cessation of the current the amalgam decomposes into mercury, ammonia, and hydrogen, the two latter escaping as gas in the proportions expressed by their atomic weights, namely, H and NH_3.—**Ammonium bases**, compounds containing one or more molecules of ammonium hydroxid, in which univalent or polyvalent radicals replace the whole or part of the hydrogen, as seen in tetrethyl-ammonium hydroxid, $N(C_2H_5)_4OH$.

amnion (am′ni-on), *n.*; pl. *amnia* (-ä). [NL., < Gr. *ἀμνίον*, the membrane around the fetus (also called *ἀμνεῖος χιτών*), also the bowl in which the blood of victims was caught at the sacrifices; < *ἀμνός*, a lamb: see *agnus*.] **1.** In *anat.* and *vertebrate zoöl.*, one of the fetal appendages; the innermost one of the membranes which envelop the embryo of the higher vertebrates, as mammals, birds, and reptiles; the lining membrane of a shut sac, familiarly called the "bag of waters," in which the fetus is contained. An amnion is developed in those vertebrates only which have a fully formed allantois; hence it is absent in the *Ichthyopsida*, or fishes and amphibians, but present in all *Sauropsida*, or reptiles and birds, and in *Mammalia*. The amnion is formed, at a very early period in the life of the embryo, by a duplication of the epiblast, or external blastodermic membrane, which, carrying with it a layer of mesoblast from the somatopleural division of the latter, rises on all sides about the embryo, the folded edges coming together over the back of the embryo, and there coalescing to form a shut sac in which the embryo is inclosed. From this mode of growth, it is obvious that what was the outer side of the amniotic folds becomes the inner side of the sac when it has shut, so that the epiblastic layer is internal, the mesoblastic external; the process of inversion being comparable to that by which, in the case of the primitive trace of the embryo, a layer of epiblast is converted into the lining of the spinal canal. Only that fold of membrane which is next the body of the embryo composes the amnion proper, the other or outer fold in contact with the enveloping primitive chorion (vitelline membrane or yolk-sac) either disappearing or taking part in the formation of the permanent chorion. As long as this outer fold is recognizable as a membrane, it bears the name of *false amnion*. The shut sac of the amnion contains the liquor amnii, a bland, albuminous, serous fluid in which the fetus is immersed. In parturition, rupture of the sac is followed by the "bursting of the waters." Sometimes a portion of the sac adheres to the head of the child, fitting like a skull-cap; such an infant is said, in the language of midwives, who commonly regard the circumstance as a good omen, to be "born with a caul." 2. In *entom.*, a membrane which surrounds the larva of many insects, as the millepeds (*Iulidæ*), for some time after they are hatched from the egg. It is regarded by some as the analogue of the amnion of a vertebrate.

amœba (a-mē′bä), *n.*; pl. *amœbas, amœbæ* ★(-bäz, -bē). [NL., ‹ Gr. *ἀμοιβή*, change, exchange, ‹ *ἀμείβειν*, change, exchange, akin to L. *movere*, › E. *move*, q. v.] **1.** [*cap.*] A genus of microscopic rhizopodous *Protozoa*, of which *A. diffluens*, common in all fresh-water ponds and ditches, is the type. It exists as a mass of protoplasm, and moves about and grasps particles of food, etc., by means of pseudopodia, or finger-like processes, which it forms by protruding portions of its body. From thus continually altering its shape it received its former name of *proteus animalcule.* Within the body are usually found a nucleus and nucleolus, and certain clear spaces, termed *contractile vesicles*, from their exhibiting rhythmical movements of contraction and dilatation. There is no distinct mouth, and food seized by means of the pseudopodia is engulfed within the soft sarcode-body and by any portion of its surface, the apertures by which the food is taken in closing up immediately after its reception. Reproduction takes place in several ways, but chiefly by fission, whereby an amœba simply divides into two portions, each of which becomes a distinct animalcule. Several other species have been described; but there is reason to think that some of these, at least, may be early forms of other and more complex animals, or even of plants. The term appears to have been first used by Ehrenberg in 1830, as the name of a genus of his *Polygastrica.*

8. Between whiles; at intervals; from time to time; now and then.—**4.** During the time; meanwhile.=**Syn.** *Amid, In the midst of, Among, Between, Betwixt.* The midst is the middle place; hence *amid* or *in the midst of* should be used where a person or thing is in a position which is, or may be imagined to be, central; they are naturally the expressions between which to choose when the noun is in the singular, or a plural noun stands for that which is virtually one: as, "Lo, I see four men loose, walking *in the midst of* the fire" (Dan. iii. 25); *amid* the waves. By derivation *among* suggests a mingling; it may be properly used with collective nouns: as, he disappeared *among* the crowd. *Between* is nearly equivalent etymologically to *by twain*, so applying only to two; *among* refers to more than two; it is therefore improper to say either *among* them both, or *between* the three. *Betwixt* is the same as *between*.

père, < *Ampère*, name of a French electrician (André Marie *Ampère*, died 1836). Cf. *ohm* and *volt*.] The unit employed in measuring the strength of an electrical current. It is the current which flows through a conductor whose resistance is one ohm, and between the two ends of which the unit difference of potentials, one volt, is maintained. As defined by the International Electrical Congress of 1893, and by a United States statute of 1894, it is one tenth of the unit of current of the centimeter-gram-second system of electromagnetic units and is represented in practice by the unvarying current which, when passed through a standard solution of nitrate of silver in water, deposits silver at the rate of 0.001118 of a gram per second.

This instrument reads only unidirectional or direct current. (2) The Thomson meter, consisting of a small movable piece of soft iron acted upon by a stationary inclined wire coil through which the current to be measured passes. (3) The dynamometer, consisting of a movable and a stationary wire coil acting magnetically upon one another and connected in series. The movable element carries the indicating needle. (4) The hot-wire meter, in which the current passes through a straight wire and is measured by the expansion of the wire caused by the heating effect of the current, the expansion being transmitted by a lever to the indicating needle. Usually the scale is graduated so that the indicating needle directly shows the amperes. Also called *ammeter*, *amperometer*.

The bodies of the animals are compressed laterally and curved longitudinally; some of the legs are directed forward, the rest backward (whence the name). The thorax has 6 or 7 segments, the abdomen 7. The tail is natatory or saltatorial. The 4 anterior locomotive limbs (namely, from the second to the fifth thoracic limb inclusive) are directed forward, the 3 posterior backward. The body ends behind in a variously shaped telson. The eyes are sessile, and sometimes rudimentary. From 2 to about 9 families of the order, the most extensive of which is the *Gammaridæ*, are recognized by different authors. They consist of certain stones, or plants, or of bits of metal, parchment, or paper, with or without mystic characters or words. The gospels and saints' relics have been used in this way. The Mohammedans use diminutive copies of the Koran hung around the neck. From the heathen and the Jews the custom passed into the primitive Christian church, where it was long maintained in spite of the decrees of ecclesiastical councils and the protests of the more intelligent clergy. The medals or slabs found in the catacombs, many of them inscribed with the word *ichthys*, fish, because this represented the initials of the Greek words for Jesus Christ, Son of God, Saviour, are in the Catholic view not amulets. They were suspended from the neck or affixed to some part of the body. See *phylactery*, 3. = **Syn.** *Amulet*, *Talisman*. An *amulet* is supposed to exert a constant protecting power, warding off evil; a *talisman*, to produce under special conditions desired results for the owner.

an[1], **a** (an, ạ, or an, ā). [< ME. *an*, before a vowel, occasionally before a consonant; *a*, before a consonant (see *a*[2]); < AS. *ān*, an, with the reg. adj. declension in sing. and pl. (pl. *āne*, some, certain), and the same word as *ān*, one, its use as an indef. art. being comparatively rare. When so used, it was without emphasis, and became in ME. short in quantity (hence E. short *an*, *a*), while the numeral *ān*, retaining its emphasis and quantity, developed reg. into E. *one*, pronounced ōn (as in *only*, *al-one*, *at-one*), in mod. times corrupted to wŏn and finally to wun: see *one*.] The indefinite article. As between the two forms of this word, the general rule is that *an* be used before an initial vowel-sound of the following word, and *a* before an initial consonant-sound: thus, *an* eagle, *an* answer, also *an* hour (the *h* being silent); and *a* bird, *a* youth, *a* wonder, also *a* use, *a* eulogy, *a* one (these three words being pronounced as if they began with *y* or *w*). But *an* is still sometimes used before a consonant-sound, especially before the weak consonant *h;* and in written style, and in more formal spoken style, *an* is by many (especially in England) required before the initial *h* of a wholly unaccented syllable, as if such an *h* were altogether silent: thus, *an* hotel, but *a* hostess; *an* historian, but *a* history; *an* hypothesis, but *a* hypothetical. In colloquial speech, and increasingly in writing, *a* is used in all these cases alike. As by its derivation, so also in meaning, *an* or *a* is a weaker or less distinct *one*. (1) In certain phrases, and with certain nouns, it still has nearly the value of *one:* thus, two of *a* trade; they were both of *a* size; *a* hundred, *a* thousand, *a* million. (2) Usually, as the indefinite article proper, it points out, in a loose way, an individual as one of a class containing more of the same kind: thus, give me *a* pint of milk; he ate *an* apple; they built *a* house; we see *a* man; the earth has *a* moon; our sun is *a* fixed star. (3) Hence, before a proper noun, it implies extension of the name or character of the individual to a class: thus, he is *a* Cicero in eloquence; they built up *a* new England in America—that is, a person like Cicero, a country like England. (4) *A* is used, apparently, before a plural noun, if *few* or *many* (now only *great many*, or *good many*) stands between: thus, *a few* apples, *a great many* soldiers; but the plural noun is here historically a genitive partitive dependent on *few*, *many*. (5) It is used distributively, or with the meaning of *each* or *every*, in such phrases as two dollars *a* piece, three times *a* day, five cents *an* ounce; but *a* or *an* is here historically a preposition. See *a*[3]. *An* or *a* always precedes the noun to which it belongs, and in general also any other adjective word qualifying the same noun; but *what* and *such* come before it: thus, *what a* shame! *such a* beauty; and so also any adjective preceded by *how*, or *so*, or *as*, or *too:* thus, *how* great *a* calamity, *so* rare *a* case, *as* good *a* man, *too* early *a* death. *Many a* is a phrase of peculiar meaning. See *many*.

an[2] (an, ạn), *conj.* [A reduced form of *and*, existing from the earliest ME. period, and often then so written; but in mod. literature *an* for *and* copulative is admitted only in representations of dialectal or 'vulgar' speech, and is then usually printed *an'*. In conversation, however, though not in formal speech, the *d* is generally dropped, especially before a word beginning with a consonant, and the vowel may be weakened to the point of vanishing. *An'* for *and*, if, is archaic in literature, and is generally printed *an*, in distinction from *and* copulative.] **I.** Coordinate use: And; same as *and*, A.

It includes the ophiocephalids as well as the anabantids proper, the osphromenids, and the helostomids. (*b*) Among later authors, a family characterized by a compressed oblong body, moderate ctenoid scales, and a superbranchial organ in a cavity accessory to the gill-chamber. It includes the osphromenids and the helostomids as well as the typical anabantids. The name is best known historically as applied to the followers of Thomas Münzer, a leader of the peasants' war in Germany, who was killed in battle in 1525, and to those of John Matthias and John Bockold, or John of Leyden, who committed great excesses while attempting to establish a socialistic kingdom of New Zion or Mount Zion at Münster in Westphalia, and were defeated in 1535, their leaders being killed and hung up in iron cages, which are still preserved in that city. The name has also been applied to bodies of very different character in other respects, probably always in an opprobrious sense, since believers in the sole validity of adult baptism refuse to regard it as rebaptism in the case of persons who had received the rite in infancy. It is now most frequently used of the Mennonites. See *Mennonite*.

By later writers it has been restricted to the forms manifesting bilateral symmetry. By Cope and Gill it has been further limited to those types which have the hypercoracoid imperforate and the foramen between the hypercoracoid and the hypocoracoid. ★**analogous** (a-nal′ō-gus), *a.* [< L. *analogus*, < Gr. *ἀνάλογος*, according to a due *λόγος* or ratio, proportionate, conformable, analogous, < *ἀνά*, throughout, according to (see *ana-*), + *λόγος*, ratio, proportion: see *logos* and *logic.*] **1.** In general, having analogy; corresponding (to something else) in some particular or particulars, while differing in others; bearing some resemblance or proportion: sometimes loosely used for *similar.* Thus, there is something in the exercise of the mind *analogous* to that of the body; animal organs, as the wing of a bird and that of a bat, which perform the same function, though different in structure, are *analogous.* See 4, below.

The effect of historical reading is *analogous*, in many respects, to that produced by foreign travel.
Macaulay, On History.

Specifically—**2.** In *chem.*, closely alike, but differing in some degree as to each of the more prominent characters.—**3.** In *bot.*, resembling in form but not in plan of structure. In *biol.*, similar physiologically but not anatomically; like in function but not in structure: the opposite of *homologous.* See *analogy*, 5.—**5.** In *logic*, from Albertus Magnus down to modern writers, applied to terms which are homonymous or equivocal in a special way, namely, those in which the identity of sound is not accidental, but is based upon a trope or upon some other reason.

A term is *analogous* whose single signification applies with equal propriety to more than one object: as, the leg of the table, the leg of the animal. *Whately.*

In all senses used with *to*, sometimes *with.* = **Syn.** Correspondent, similar, like.

The mechanical law, that action and reaction are equal, has its moral *analogue.* *H. Spencer*, Social Statics, p. 253.

It [cynicism] is the intellectual *analogue* of the truffle; and though it may be very well in giving a relish to thought for certain palates, it cannot supply the substance of it.
Lowell, Study Windows, p. 137.

Specifically—**2.** In *philol.*, a word corresponding with another; an analogous term.—**3.** In *zoöl.* and *bot.*, an animal or a plant corresponding in some special and essential attributes or relations to a member of another group or region, so that it is a representative or counterpart.—**4.** In *biol.*, an organ that has the same function in one species or group as an organ of different structure or origin in another species or group. The difference between *homologue* and *analogue* may be illustrated by the relation between the wing of a bird and that of a butterfly: as the two differ totally in anatomical structure and in their history, they cannot be said to be *homologues*, but they are *analogues*, since both serve for flight. See *analogy*, 5.

★**analogy** (a-nal′ō-ji), *n.*; pl. *analogies* (-jiz). [< F. *analogie*, < L. *analogia*, < Gr. *ἀναλογία*, equality of ratios, proportion, analogy, < *ἀνάλογος*, analogous: see *analogous.*] **1.** In *math.*, an equation between ratios. This use is obsolete except in a few phrases, as *Napier's analogies*, which are four important formulas of spherical trigonometry.

2. An agreement, likeness, or proportion between the relations of things to one another; hence, often, agreement or likeness of things themselves. *Analogy* strictly denotes only a partial similarity, as in some special circumstances or effects predicable of two or more things in other respects essentially different: thus, when we say that learning *enlightens* the mind, we recognize an *analogy* between learning and light, the former being to the mind what the latter is to the eye, enabling it to discover things before hidden. [We say that there is an analogy *between* things, and that one thing has analogy *to* or *with* another.]

Intuitive perceptions in spiritual beings may, perhaps, hold some *analogy* unto vision.
Sir T. Browne, Christ. Mor., iii. 15.

In philosophy, *analogy* does not consist in the equality of two quantities, but of two qualitative relations.
Kant, Critique of Pure Reason (tr. by Max Müller).

Specifically—**3.** In *logic*, a form of reasoning in which, from the similarity of two or more things in certain particulars, their similarity in other particulars is inferred. Thus, the earth and Mars are both planets, nearly equidistant from the sun, not differing greatly in density, having similar distributions of seas and continents, alike in conditions of humidity, temperature, seasons, day and night, etc.; but the earth also supports organic life; hence Mars (probably) supports organic life—is an *argument from analogy.* See *induction.*

4. In *gram.*, conformity to the spirit, structure, or general rules of a language; similarity as respects any of the characteristics of a language, as derivation, inflection, spelling, pronunciation, etc.—**5.** In *biol.*, resemblance without affinity; physiological or adaptive likeness between things morphologically or structurally unlike: the opposite of *homology.* Thus, there is an analogy between the wing of a bird and that of a butterfly, both being adapted to the same physiological purpose of flight, but there is no morphological relation between them. Analogy rests upon mere functional (that is, physiological) modifications; homology is grounded upon structural (that is, morphological) identity or unity. Analogy is the correlative of physiology, homology of morphology; but the two may be coincident, as when structures identical in morphology are used for the same purposes and are therefore physiologically identical.—**Analogy of faith**, in *theol.*, the correspondence of the several parts of revelation with one another.

analphabet, analphabete (an-al′fa-bet, -bēt), *a.* and *n.* [< ML. *analphabetus*, < Gr. *ἀναλφάβητος*, not knowing one's A B C, < *ἀν-* priv. + *ἀλφάβητος*, the A B C, alphabet: see *alphabet.*] **I.** *a.* Not knowing the alphabet; illiterate.

★**analysis** (a-nal′i-sis), *n.* [Formerly *analyse*, < F. *analyse* = Pg. *analyse* or *analysis* = Sp. *análisis* = It. *analisi*, < ML. *analysis*, < Gr. *ἀνάλυσις*, a dissolving, resolution of a whole into its parts, solution of a problem, analysis, lit. a loosing, < *ἀναλύειν*, resolve into its elements, analyze, lit. loosen, undo, < *ἀνά*, back, + *λύειν*, loosen: see *loosen.*] **1.** The resolution or separation of anything which is compound, as a conception, a sentence, a material substance, or an event, into its constituent elements or into its causes; decomposition.

In the deductive syllogism we proceed by *analysis*—that is, by decomposing a whole into its parts.
Sir W. Hamilton.

In the associationalist psychology, the *analysis* of an idea is the discovery of the different kinds of elementary sensations which are associated together to produce the idea. *Mill.*

Analysis is real, as when a chemist separates two substances. Logical, as when we consider the properties of the sides and angles of a triangle separately, though we cannot think of a triangle without sides and angles.
Fleming, Vocab. of Phil.

The *analysis* of a material object consists in breaking it up into those other material objects which are its elements, and it is only when we know something of the properties of these elements as they exist separately that we regard an *analysis* of the whole as satisfactory. *Mind*, IX. 80.

2. The regressive scientific method of discovery; research into causes; induction.—**3.** In *math.*: (*a*) Originally, and still frequently, a regressive method, said to have been invented by Plato, which first assumes the conclusion and gradually leads back to the premises. The thirteenth book of Euclid's Elements has the following definition, which is not supposed to be by Euclid, but which is ancient, and perhaps by Eudoxus: Analysis is the proceeding from the thing sought, as conceded, by consequences to some conceded truth; *synthesis* is the proceeding from the conceded by consequences to the truth sought. According to Pappus, analysis is of two kinds: *theoretical*, so called because used in research into truth, and *problematic*, so called because used in the solution of problems. In the former, the proposition to be proved is assumed as true, and consequences are drawn from it until something conceded is reached, which if it is true involves the truth of the thing sought, the demonstration corresponding to the analysis; in the latter, the construction sought is assumed as already known, and consequences are deduced from it until something given is reached. (*b*) Algebraical reasoning, in which unknown quantities are operated upon in order to find their values. *Vieta.* (*c*) The treatment of problems by a consideration of infinitesimals, or something equivalent, especially by the differential calculus (including the integral calculus, the calculus of variations, etc.): often called *infinitesimal analysis.* This is the common meaning of the word in modern times. Hence—(*d*) The discussion of a problem by means of algebra (in the sense of a system of symbols with rules of transformation), in opposition to a geometrical discussion of it, that is, a discussion resting directly upon the imagination of space: thus, analytical geometry is the treatment of geometrical problems by *analysis.*—**4.** A syllabus or synopsis of the contents of a book or discourse, or of the principles of a science.—**Analysis of a plant**, an examination of its structure and characters as a preliminary to its determination.—**Chemical analysis, Diophantine analysis,** etc. See the adjectives.—**Fluxional analysis.** See *method of fluxions*, under *fluxion.*—**Gasometric analysis, harmonic analysis,** etc. See the adjectives.—**Qualitative analysis**, in *chem.*, the detection of the constituents of a compound body, in distinction from **quantitative analysis**, or the determination of the amounts and proportions of the constituents.—**Spectrum analysis.** See *spectrum.* = **Syn.** *Assay, Analysis.* See *assay.*

The *analyst* has not very many resources at his disposal for separating an intimate mixture of several bodies.
Pop. Sci. Mo., XXV. 203.

★**analytic, analytical** (an-a-lit′ik, -i-kal), *a.* and (in the first form) *n.* [< ML. *analyticus*, < Gr. *ἀναλυτικός*, analytic, < *ἀνάλυτος*, dissoluble, verbal adj. of *ἀναλύειν*, dissolve, resolve, analyze: see *analysis.*] **I.** *a.* **1.** Relating to, of the nature of, or operating by analysis: opposed to *synthetic, synthetical:* as, an *analytic* mode of thought.

His [Webster's] mind was *analytical* rather than constructive, and his restlessness of life was indicative of a certain instability of temper.
H. E. Scudder, Noah Webster, iv.

2. In the *Kantian logic*, explicatory; involving a mere analysis or explication of knowledge, and not any material addition to it.

In all judgments in which there is a relation between subject and predicate (I speak of affirmative judgments only, the application to negative ones being easy), that relation can be of two kinds. Either the predicate B belongs to the subject A as something contained (though covertly) in the concept A; or B lies outside of the sphere of the concept A, though somehow connected with it. In the former case I call the judgment *analytical;* in the latter, synthetical. *Analytical* judgments (affirmative) are therefore those in which the connection of the predicate with the subject is conceived through identity, while others in which that connection is conceived without identity may be called synthetical.
Kant, Critique of Pure Reason (tr. by Max Müller).

3. In *philol.*, deficient in inflections, and employing instead particles and auxiliary words to express modifications of meaning and to show the relations of words in a sentence: as, an *analytic* language.—**Analytical chemistry,** the science of determining the components of a compound. It may be qualitative or quantitative.—**Analytical definition.** See *definition.*—**Analytical geometry,** geometry treated by means of ordinary algebra, with a reference, direct or indirect, to a system of coördinates. See *coördinate.* In ordinary rectangular coördinates, for example, there is just one point of space for every set of values of the three variables, *x*, *y*, *z*. If, now, an equation is assumed between these variables, some of the sets of otherwise possible values will be excluded, and thus some of the points of space will be debarred to us, and we shall be restricted to a certain "locus" or place; and since the number of independent variables is, in consequence of the equation, reduced by one, the number of dimensions of the locus at any one point will be one less than that of space, so that the locus will be a surface. By the use of such equations of loci every problem of geometry is reduced to a problem of algebra, and the whole doctrine of geometry is mathematically identified with the algebra of three variables. Thus, to discover that, when four equations subsist between three unknown quantities, they can be satisfied simultaneously, amounts to discovering that, when a certain geometrical relation subsists between four surfaces, they meet in a common point. The idea of analytical geometry is exclusively due to the genius of Descartes (1596–1650), who published his *Géométrie*, containing illustrations of the new method, in 1637.—**Analytical jurisprudence,** a theory and system of jurisprudence wrought out neither by inquiring for ethical principles or the dictates of the sentiment of justice, nor for the rules which may be actually in force, but by analyzing, classifying, and comparing various legal conceptions. The best known of the analytical jurists are Bentham and

Austin.—**Analytical key**, in *bot.*, an arrangement of the prominent characters of a group of orders, or of genera, etc., in such a manner as to facilitate the determination of plants.—**Analytical mechanics**, the science of mechanics treated by the infinitesimal calculus.—**Analytic function**. See *function*.—**Analytic method**, in *logic*, a method which proceeds regressively or inductively from known particulars to the recognition of general principles, in opposition to the *synthetic method*, which advances from principles to particulars.

Gr. and L.), anything devoted to evil, an accursed thing, a curse; esp. of excommunication, an accursed or excommunicated person; in classical Greek simply 'anything offered up or dedicated,' being another form of the regular *ἀνάθημα*, a votive offering set up in a temple, esp. as an ornament, hence also an ornament, a delight (> LL. *anathēma*, an offering, a gift), lit. 'that which is set up'; < *ἀνατιθέναι*, set up, dedicate, offer, < *ἀνά*, up, + *τιθέναι*, put, place, set: see *ana-* and *theme*. The forms of *anathema* are thus distinguished: *anathēma*, when the dedication is carried out by the preservation of the object as a pious offering (Luke xxi. 5); *anathēma*, when it has in view the destruction of the object as accursed (Josh. vii. 12). A relic of the former and original sense of the word is found in the *anathēmata* of the middle ages, which were gifts and ornaments bestowed upon the church and con-

secrated to the worship of God. The principal English uses, however, are derived from the form *anathĕma*.] **1.** A person or thing held to be accursed or devoted to damnation or destruction.

Also called *judiciary anathema*. The formula, "which if anybody deny let him be *anathema*," is commonly added to the decrees of ecclesiastical councils, and especially to the doctrinal canons of ecumenical councils. It is denied by some theologians that the idea of a curse properly belongs to the anathema as used in the Christian church. See *excommunication*.

In pronouncing *anathema* against wilful heretics, the Church does but declare that they are excluded from her communion, and that they must, if they continue obstinate, perish eternally. *Cath. Dict.*

The name is derived from some fancied resemblance of the *Lepas anatifera* to a bird, whence arose the vulgar error that the barnacle-goose, *Anas* or *Anser bernicla*, was produced from this cirriped, which was supposed to turn into the bird when it dropped from the tree upon which it was fabled to grow. [Disused.] See *Lepadidæ*, *Lepas*.

They are separated from the *Fuligulinæ*, or sea-ducks, by having the hallux simple, not lobed. The name *Anatinæ* has occasionally been used to distinguish the "ducks," collectively, from other *Anatidæ*, as the swans, geese, and mergansers; in this use it includes the *Fuligulinæ*. The *Anatinæ* proper include the mallard (*Anas boscas*), the wild original of domestic ducks, and many other species, as the widgeon, gadwall, pintail, shoveler, wood-duck, and the various kinds of teal. anchitheriid (ang-ki-thē'ri-id), *n.* A hoofed mammal of the family *Anchitheriidæ.*

Anchitheriidæ (ang-ki-thē-rī'i-dē), *n. pl.* [NL., < *Anchitherium* + *-idæ.*] A family of fossil perissodactyl ungulate mammals. It shares the ungulate characters of the *Equidæ*, or horses, but differs from them in having the ulna complete, moderately developed, and more or less distinct from the radius; the fibula complete, though ankylosed with the tibia; the orbit of the eye incomplete behind; the upper molar teeth marked by a deep anterior groove reentering from the middle of the inner side and ending in lateral branches, and a posterior groove reentering from the posterior wall; and the lower molars marked by a V-shaped groove reentering from the outer wall, and two V-shaped grooves reentering from the inner wall, the crowns thus having W-shaped ridges. Besides the typical genus *Anchitherium*, the family contains the *Hypohippus*, *Parahippus*, and *Anchippus* of Leidy.

anchitherioid (ang-ki-thē'ri-oid), *a.* [< *Anchitherium* + *-oid.*] Relating or belonging to or resembling the genus *Anchitherium.*

The only genus of animals of which we possess a satisfactory . . . ancestral history is the genus Equus, the development of which in the course of the Tertiary epoch from an *Anchitherioid* ancestor, through the form of Hipparion, appears to admit of no doubt.
Huxley, Encyc. Brit., II. 49.

Anchitherium (ang-ki-thē'ri-um), *n.* [NL., < Gr. *ἀγχι*, near, + *θηρίον*, a wild beast.] A genus of extinct perissodactyl or odd-toed hoofed mammals, found in the Upper Eocene and Middle Miocene of Europe and the United States. It was a kind of horse about the size of a small pony, and had three functionally developed toes. By some naturalists it is referred to the same family as the modern horse, *Equidæ*; but by others it is placed with *Palæotherium* in the family *Palæotheriidæ.* It is also, with greater exactness, made the type of a distinct family, *Anchitheriidæ* (which see). A species is *A. aurelianense.* Synonymous with *Hipparitherium.*

Common Anchor.

Anchors are generally made of iron, and consist of a strong shank *a*, at one extremity of which is the crown *c*, from which branch out two arms *b b*, curved inward, and each terminating in a broad palm or fluke *d d*, the sharp extremity of which is the peak or bill. At the other end of the shank is the stock *e e*, a transverse piece, behind which is a shackle or ring, to which a cable may be attached. The principal use of the stock, which in nearly all anchors is now made of iron and is placed at right angles to the curved arms *b b*, is to cause the arms to fall so that one of the flukes shall enter the ground. According to their various forms and uses, anchors are called *starboard-bower, port-bower, sheet, spare, stream, kedge*, and *grapnel* or *boat* anchors. Those carried by men-of-war are the *starboard-* and *port-bowers*, on the starboard and port bows respectively; the *sheet*, on either side of the ship further aft; and the *spare* anchor, which is usually in the hold. These are all of equal or nearly equal size and weight. To these are added for various purposes the *stream* and *kedge* anchors, which are smaller and of various sizes. Many improvements and novelties in the shape and construction of anchors have been introduced in recent times. The principal names connected with these alterations are those of Lieut. Rodgers, who introduced the *hollow-shanked anchor*, with the view of increasing the strength without adding to the weight; Mr. Porter, who made the arms and flukes movable by pivoting them to the shank instead of fixing them immovably, causing the anchor to take a readier and firmer hold, and avoiding the danger of fouling the cable; Mr. Trotman, who has further improved Porter's invention; and M. Martin, whose anchor is of very peculiar form, and is constructed so as to be self-canting, the arms revolving through an angle of 30° either way, and the sharp points of the flukes being always ready to enter the ground. Of the many other forms, all (except Tyzack's anchor, which has only one arm, pivoted on a bifurcation of the shank and arranged to swing between the two parts) are more or less closely related to the forms illustrated. The anchor is said to be *a-cockbill* when it is suspended vertically from the cathead ready to be let go; *apeak* when the cable is drawn in so tight as to bring it directly under the ship; *atrip* or *aweigh* when it is just drawn out of the ground in a perpendicular direction; and *awash* when the stock is hove up to the surface of the water.

3. Specifically, in *law*, of more than 20 or 30 years' duration: said of anything whose continued existence for such a period is taken into consideration in aid of defective proof by reason of lapse of memory, or absence of witnesses, or loss of documentary evidence: as, an *ancient* boundary.—**4.** Past; former.

5. In *her.*, formerly worn; now out of date or obsolete: thus, France *ancient* is azure semée with fleurs-de-lys or, while France modern is azure, 3 fleurs-de-lys, or 2 and 1.—**Ancient demesne.** See *demesne*.—**Syn.** *Ancient*, *Old*, *Antique*, *Antiquated*, *Old-fashioned*, *Quaint*, *Obsolete*, *Obsolescent*, bygone. *Ancient* and *old* are generally applied only to things subject to change. *Old* may apply to things which have long existed and still exist, while *ancient* may apply to things of equal age which have ceased to exist: as, *old* laws, *ancient* republics. *Ancient* properly refers to a higher degree of age than old: as, *old* times, *ancient* times; *old* institutions, *ancient* institutions. An *old*-looking man is one who seems advanced in years, while an *ancient*-looking man is one who seems to have survived from a past age. *Antique* is applied either to a thing which has come down from antiquity or to that which is made in imitation of ancient style: thus, *ancient* binding is binding done by the ancients, while *antique* binding is an imitation of the ancient style. *Antiquated*, like *antique*, may apply to a style or fashion, but it properly means *too old*; it is a disparaging word applied to ideas, laws, customs, dress, etc., which are out of date or outgrown: as, *antiquated* laws should be repealed; his head was full of *antiquated* notions. *Old-fashioned* is a milder word, noting that which has gone out of fashion, but may still be thought of as pleasing. *Quaint* is old-fashioned with a pleasing oddity: as, a *quaint* garb, a *quaint* manner of speech, a *quaint* face. *Obsolete* is applied to that which has gone completely out of use: as, an *obsolete* word, idea, law. *Obsolescent* is applied to that which is in process of becoming obsolete. *Ancient* and *antique* are opposed to *modern*; *old* to *new*, *young*, or *fresh*; *antiquated* to *permanent* or *established*; *old-fashioned* to *new-fashioned*; *obsolete* to *current* or *present*. *Aged*, *Elderly*, *Old*, etc. See *aged*.

and (and, unaccented and: see *an*[2]), *conj.* [< ME. *and, ant, an,* sometimes *a,* < AS. *and, ond,* rarely *end* (in AS. and ME. usually expressed by the abbrev. symbol or ligature ⁊, later &c (mod. &), for L. *et,* and), = OS. *endi,* rarely *en,* = OFries. *anda, ande, and, an,* rarely *ond,* also *ende, enda, end, en,* mod. The Teut. prepositions and prefixes containing a radical *n* tended to melt into one another both as to form and sense. There appear to have been orig. two forms of *and,* namely, (*a*) AS. *and, ond,* OS. *ant,* Goth. *and, anda-,* Teut. **anda-,* and (*b*) AS. *end,* OS. *endi,* etc., Teut. **andi-,* the latter being = L. *ante,* before, = Gr. ἀντί, against, = Skt. *anti,* over against, near, related with *anta,* end, = Goth. *andeis* = AS. *ende,* E. *end:* see *end,* and cf. *andiron.* See *and-, an-*[2], *on-*[2], *ante-, anti-,* prefixes ult. identical. For the transition from the prep. *and,* before, besides, with, to the conj. *and,* cf. the prep. *with* in such constructions as "The passengers, *with* all but three of the crew, were saved," where *and* may be substituted for *with.* From the earliest ME. period *and* has also existed in the reduced form *an:* see *an*[2].] **A.** *Coördinate use.* 1. Connective: A word connecting a word, phrase, clause, or sentence with that which precedes it: a colorless particle without an exact synonym in English, but expressed approximately by 'with, along with, together with, besides, also, moreover,' the elements connected being grammatically coördinate.

> In our last conflict four of his five wits went halting off, *and* now is the whole man governed with one.
> *Shak.,* Much Ado, i. 1.

We have been up *and* down to seek him.
Shak., M. of V., iii. 1.

His fame *and* fate shall be
An echo *and* a light unto eternity.
Shelley, Adonais, l. 8.

Along the heath *and* near his favourite tree.
Gray, Elegy, l. 110.

When many words, phrases, clauses, or sentences are connected, the connective is now generally omitted before all except the last, unless retained for rhetorical effect. The connected elements are sometimes identical, expressing continuous repetition, either definitely, as, to walk two *and* two; or indefinitely, as, for ever *and* ever, to wait years *and* years.

To-morrow, *and* to-morrow, *and* to-morrow,
Creeps in this petty pace from day to day,
To the last syllable of recorded time.
Shak., Macbeth, v. 5.

The repetition often implies a difference of quality under the same name: as, there are deacons *and* deacons (that is, according to the proverb, "There's odds in deacons"); there are novels *and* novels (that is, all sorts of novels). To make the connection distinctly inclusive, the term *both* precedes the first member: as, *both* in England *and* in France. For this, by a Latinism, *and* . . . *and* has been sometimes used in poetry (Latin and French *et* . . . *et*).

Thrones *and* civil *and* divine.
Sylvester, tr. of Du Bartas.

2. Introductive: in continuation of a previous sentence expressed, implied, or understood.

In this use, especially in continuation of the statement implied by assent to a previous question. The continuation may mark surprise, incredulity, indignation, etc.: as, *And* shall I see him again? *And* you dare thus address me?

And do you now put on your best attire,
And do you now cull out a holiday,
And do you now strew flowers in his way,
That comes in triumph over Pompey's blood?

Casella's Anemometer.

Casella's portable anemometer, designed for measuring the velocity of air-currents in mines and ventilating shafts, consists of a wind-wheel attached to a counting arrangement. Anemometers for indicating velocity are commonly formed of plane surfaces or drums exposed to the wind, and so arranged as to yield to its pressure and indicate the amount by their movements. *Linds's anemometer* consists of a glass tube bent into the form of an inverted siphon, graduated, partly filled with water, and mounted as a weathercock. To one of its open ends a metallic cylinder of the same bore as the tube is attached at right angles. The pressure of the wind blowing into this causes the water to sink in one arm of the tube and to rise in the other, and the difference of level of the two columns of water, which is measured by the amount of fall plus the amount of rise, as shown by the graduated scales, gives the force or pressure of the wind. By the use of mechanical or electrical appliances anemometers may be made to record as well as measure variations in the velocity and pressure of the wind. When they record the velocity or direction, or both, they are sometimes called *anemographs*; when they indicate the direction only, they are called *anemoscopes*; when they automatically record velocity, direction, and pressure, they are called *anemometrographs* or *anemometrographic registers*.

3. An individual fit of anger; an expression of anger, as a threat: in this sense it may be used in the plural.

Tennyson, Madeline.

4. Pain or smart, as of a sore or swelling. This sense is still retained by the adjective. See *angry*, 8. [Obsolete or dialectal.]

= **Syn.** *Anger*, *Vexation*, *Indignation*, *Resentment*, *Wrath*, *Ire*, *Choler*, *Rage*, *Fury*, passion, displeasure, dudgeon, irritation, gall, bile, spleen. *Vexation* is the least forcible of these words, expressing the annoyance and impatient chafing of one whose mood has been crossed, whose expectations have not been realized, etc. *Indignation* may be the most high-minded and unselfish; it is intense feeling in view of grossly unworthy conduct, whether toward one's self or toward others. The other words denote almost exclusively feeling excited by the sense of personal injury. *Anger* is a sudden violent feeling of displeasure over injury, disobedience, etc., accompanied by a retaliatory impulse; it easily becomes excessive, and its manifestation is generally accompanied by a loss of self-control. *Resentment* is the broadest in its meaning, denoting the instinctive and proper recoil of feeling when one is injured, and often a deep and bitter brooding over past wrongs, with a consequent hatred and settled desire for vengeance; it is, in the latter sense, the coolest and most permanent of these feelings. *Wrath* and *ire* express sudden feeling of great power, and are often associated with the notion of the superiority of the person: as, the *wrath* of Jove, the *ire* of Achilles. They are often the result of wounded pride. *Ire* is poetic. *Wrath* has also an exalted sense, expressive of a lofty indignation visiting justice upon wrong-doing. *Rage* is an outburst of anger, with little or no self-control; *fury* is even more violent than *rage*, rising almost to madness. The chief characteristic of *choler* is quickness to rise; it is irascibility, easily breaking into a high degree of resentful feeling.

White was her cheek; sharp breaths of *anger* puff'd
Her fairy nostril out. *Tennyson*, Merlin and Vivien.

One who fails in some simple mechanical action feels *vexation* at his own inability — a *vexation* arising quite apart from any importance of the end missed.

Irving, Indian Character.

When the injury he resented was a personal one, he apologized frankly for his *anger*, if it had transgressed the bounds of Christian *indignation;* but, when he was indignant with falsehood, injustice, or cowardly wrong done to another, it was terrible to see his whole face knit itself together with *wrath*. *S. A. Brooke*, F. W. Robertson, II. ii.

To be angry about trifles is mean and childish; to rage and be furious is brutish; and to maintain perpetual *wrath* is akin to the practice and temper of devils; but to prevent and suppress rising *resentment* is wise and glorious, is manly and divine. *Watts.*

Angle[2] (ang'gl), *n.* [In mod. use only as a historical term; < L. *Anglus*, usually in pl. *Angli* (first in Tacitus), repr. the OTeut. form found in AS. *Angle*, *Ongle*, *Ængle*, reg. *Engle*, pl. (in comp. *Angel-*, *Ongel-*), the people of *Angel*, *Angol*, *Angul*, *Ongul* (= Icel. *Öngull*), a district of what is now Schleswig-Holstein, said to be so named from *angel*, *angul*, *ongul*, a hook, in ref. to its shape: see *angle*[1]. Hence *Anglo-*, *Anglo-Saxon*, *English*, q. v.] One of a Teutonic tribe which in the earliest period of its recorded history dwelt in the neighborhood of the district now called Angeln, in Schleswig-Holstein, and which in the fifth century and later, accompanied by kindred tribes, the Saxons, Jutes, and Frisians, crossed over to Britain and colonized the greater part of it. The Angles were the most numerous of these settlers, and founded the three kingdoms of East Anglia, Mercia, and Northumbria. From them the entire country derived its name *England*, the "land of the Angles." See *Anglian*, *Anglo-Saxon*, and *English*.

angle[3] (ang'gl), *n.* [< ME. *angle*, *aungel*, sometimes *angule*, < OF. *angle* = Pr. *angle* = Sp. Pg. *angulo*, It. *angolo*, < L. *angulus*, a corner, an angle, prob. orig. **anculus* (cf. *ancus*, bent, crooked) = Gr. *ἀγκύλος*, bent, crooked, curved, connected with *ἀγκών*, the bend of the arm, the elbow (see *ancon*), *ἄγκος*, a glen, dell (prop. a bend, hollow), *ὄγκος*, a hook, barb, angle, = L. *uncus*, bent, curved, a hook (see *uncous*); all appar. < √ **ank*, bend (appearing also in Gr. *ἄγκυρα*, > L. *ancora*, > E. *anker*[1], *anchor*[1]), Skt. √ *anch*, bend, and prob. connected with the Teut. group represented by *angle*[1]: see *angle*[1].]

1. A corner; the figure formed by two rays starting from the same point. The rays are called the *sides* or *legs* of the angle, and their common point its *vertex* or *angular point*. The symbol for *angle* is ∢. When the angle whose sides are *h* and *k* is set off from the vertex O against one of the rays of the angle AOB toward the other ray, if its second side falls within the angle AOB, then it is said to be less than AOB. In symbols ∢ (*h*, *k*) < ∢ AOB. Angles receive different names, according to their magnitude, their construction, their position, etc. When one straight line intersects another so as to make the four angles so formed equal, these angles are called *right* angles. One ninetieth of a right angle is called a *degree of angle*; this cuts out on any

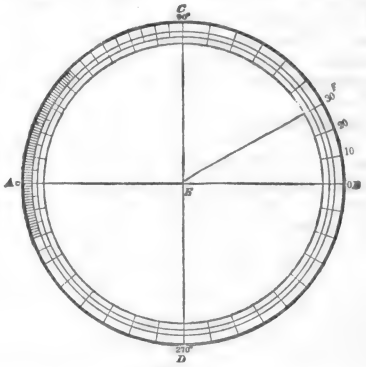

Fig. 1.

circle with center at the angular point an arc called a *degree of arc*. So to find the number of degrees of angle in any given angle we may count the number of degrees of arc in the arc intercepted on any circle with the angle's vertex for center. An arc of ninety degrees (90°) is called a *quadrant*, and this word is also applied to each of the four infinite regions made by a horizontal and a vertical straight line. The upper right-hand quadrant (between EB and EC in fig. 1) is called the first quadrant, and degrees are numbered counterclockwise. So fig. 1 shows ∢ BEF = 30°. The degree, 1°, is subdivided into 60 equal parts called minutes (60′); and the minute, 1′, into 60 equal parts called seconds (60″). The arc whose length is equal to the radius subtends an angle of 57° 17′ 44″.8 nearly. This angle is called a *radian* and is taken as the unit angle in higher mathematics. An angle is *c* times the logarithm of the anharmonic ratio made by the two sides with the two tangents to the absolute intersecting at the vertex. BCD, fig. 2, is a *right* angle. An angle which is less than a right angle is *acute*, as BCF. An *obtuse* angle is one which is greater than a right angle, as BCE. *Acute* and *obtuse* angles are both called *oblique*, in opposition to *right* angles. A *curvilinear* angle is taken to be the angle formed by the tangents to the two curved lines at their point of intersection. *Adjacent* or *contiguous* angles are such as have the vertex and one leg common to both angles, both together being equal to two right angles. Thus, in fig. 2, BCE and ECA are *adjacent* angles. *Explemental* angles are two angles having a common vertex and common legs, one being reflex or straight. A *straight* angle is an angle of 180°. A *reflex* angle is one greater than 180°. *Exterior*, *external*, or *outward* angles are the angles of any rectilinear figure without it, made by producing one of the sides at each vertex, the angles formed within the figure being called *interior* angles. When one line intersects a pair of lines in a plane, of the eight angles so formed, those which are between the pair are called *interior*, those without *exterior*. Of the interior (or exterior) angles, a pair for different sides of the intersecting line, and at different intersected lines, are called *alternate* (which see). Two angles on the same side of the transversal, and both interior or both exterior, are called *conjugate angles*.

We also speak of the solid angle of a cone. A solid angle is proportional to the spherical polygon it intercepts on the surface of a sphere, having its center at the vertex.—**Sphenoidal angle.** See *craniometry.*—**Spherical angle,** an angle on the surface of a sphere made by arcs of two great circles. Thus, if AE and CE be arcs of great circles intersecting each other at the point E, the angle AEC is the spherical angle which they make one with the other, and it is equal to the angle of inclination of the planes of the great circles AB and CD. Cf. D. *Angelsakser*, n., *-saksisch*, a., Sw. *Angelsachsare*, n., *Angelsachsisk*, a., Dan. *Angelsachser*, n., *Angelsachsisk*, a., based on the G. *Angelsachse*, pl. *-en*, n., *Angelsächsisch*, a.; all mod.] **I.** *n.* 1. (*a*) Literally, one of the Angle or 'English' Saxons; sometimes restricted to the Saxons who dwelt chiefly in the southern districts (Wessex, Essex, Sussex, Middlesex—names which contain a form of *Saxon*—and Kent) of the country which came to be known, from a kindred tribe, as the land of the Angles, *Engla land*, now *England*, but usually extended to the whole people or nation formed by the aggregation of the Angles, Saxons, and other early Teutonic settlers in Britain, or the whole people of England before the conquest. (*b*) *pl.* The English race; all persons in Great Britain and Ireland, in the United States, and in their dependencies, who belong, actually or nominally, nearly or remotely, to the Teutonic stock of England; in the widest use, all English-speaking or English-appearing people.—2. [The adj. used absolutely.] The language of the Anglo-Saxons; Saxon; the earliest form of the English language, constituting, with Old Saxon, Old Friesic, and other dialects, the Old Low German group, belonging to the so-called West Germanic division of the Teutonic speech. The first Anglo-Saxon dialect to receive literary cultivation was that of the Angles (Anglo-Saxon *Ængle*, *Engle*): hence the name *Ænglisc*, *Englisc*, that is, *English*, was afterward applied to all the dialects, and particularly to the prevailing one, West Saxon; it is the origin of the name *English* as applied to the modern mixed language. (See *English* and *English*.) A Middle Latin name for the language was *lingua Saxonica*, or *lingua Saxonum* or *Anglosaxonum*. The Anglo-Saxon language, in the widest use of the name, consisted of several dialects: the Northern or Anglian group, including the Old Northumbrian and the Midland or Mercian dialects, and the Southern or Saxon group, including the West Saxon and the Kentish. The Kentish remains are scanty, the Mercian scantier still and doubtful, while the Old Northumbrian remains are considerable. The great bulk of the Anglo-Saxon literature is West Saxon, the two terms being practically synonymous except when expressly distinguished as generic and specific. In the Old or Middle English period the Midland dialect became conspicuous, and it is to it that the form of modern English is chiefly due. In this dictionary *Anglo-Saxon* (abbreviated AS.) includes the whole language (but chiefly West Saxon, the Old Northumbrian and Kentish being discriminated when necessary) from the middle of the fifth century, or rather from the seventh century, when the first contemporary records begin, to the middle or end of the twelfth century; the language from the conquest (1066) to the end of this period being 'late Anglo-Saxon.' See *English*.

Several of the English scholars who are most active in the study of early English wage war on *Anglo-Saxon*. They attack the word. . . . They are still more hostile to the suggestion which goes with the word, that the speech called *Anglo-Saxon* is different from modern English, so as to deserve a separate name. They say there has been but one speech spoken in England by the Teutonic tribes and their descendants from Cædmon to Tennyson. . . . This classic *Anglo-Saxon* differs from our English in phonology, . . . in vocabulary, . . . [in] inflections, . . . in the derivation of words, . . . [in] syntax, . . . [in] versification [see *alliteration*], . . . [and in] the modes of thought. . . . The former is a synthetic German speech, with its own periods of early irregular idiom, classic cultivation, decline and fall into dialects; the latter an analytic mixed speech of Romanic cultivation, with other periods of growth, and classic regularity and progress. And a chaos separates the two languages. It is only when attention is directed to the history of etymological forms that unity can be plausibly claimed for them. . . . But while the importance of these forms in tracing the descent of languages is probably not overrated, their weight in establishing identity or similarity may easily be. . . . The proposed use of *Old English* [in place of *Anglo-Saxon*] does not distinguish, but confounds all the periods of *Anglo-Saxon* and the two early periods of English. . . . The reasons urged for this nomenclature are in great part sentimental. It is thought to magnify the English language and race to represent

them as Low German, having an unbroken history parallel with that of the High German, and reaching through a more famous career to a more venerable antiquity. But Americans are taught to believe in mixed races, and it magnifies the English most in our eyes to represent it in the old fashion, as formed by the junction of two great languages, the bearers of the best cultivation of the Teutonic and Romanic races.

anharmonic (an-här-mon'ik), *a.* [= F. *anharmonique;* < Gr. ἀν- priv. (*an-*[5]) + *harmonic*, q. v.] Not harmonic; in *geom.*, a term applied by Chasles to an important kind of ratio introduced into geometry by Möbius. If *a, x, y, b* are four values of a unidimensional variable (for instance, the positions of four points on a line), then $[(x-a):(x-b)] \times [(y-b):(y-a)]$ is called the *anharmonic ratio* of the four values. The intersections of a plane pencil of four lines with a transversal have the same anharmonic ratio, however the transversal may be situated; and this ratio is called the *anharmonic ratio* of the pencil. Anharmonic ratios are always preserved in orthographic projections. By means of these ratios, metrical properties are defined as projective properties of the absolute, or conic at infinity. See *absolute, n.*, 2. If from the intersection of two lines tangents are drawn to the absolute, the logarithm of the anharmonic ratio of the pencil so formed multiplied by $\frac{1}{2}\sqrt{-2}$ is the angle of the first two lines. So, the logarithm of the anharmonic ratio of two points, together with the intersections of their connecting line with the absolute, when multiplied by a constant, gives the distance of these points.—**Anharmonic property**, in *geom.*, a property that is connected with an anharmonic ratio.

aniline (an'i-lin), *n.* and *a.* [< *anil* (with reference to the brilliant violet and indigo dyes which, with others, are prepared from aniline) + *-ine*[2].] **I.** *n.* Aminobenzene, or phenylamine, $C_6H_5NH_2$, the starting-point in the preparation of a number of brilliant dyes. It was discovered in 1826 by Unverdorben, as a product of the distillation of indigo, and called by him *crystallin*. It did not acquire commercial importance until 1856, when the purple dye mauve was prepared from it by Perkin. It is found in small quantities in coal-tar, but the aniline of commerce is obtained from benzene, another product of coal-tar, consisting of hydrogen and carbon, C_6H_6. Benzene when acted on by nitric acid produces nitrobenzene; and this latter substance when treated with nascent hydrogen, usually generated by the action of acetic acid upon iron filings or scraps, produces aniline, which is an oily liquid, colorless when pure, somewhat heavier than water, having a peculiar vinous smell and a burning taste. It is a strong base, and yields well-characterized salts. When acted on by arsenic acid, potassium bichromate, stannic chlorid, etc., aniline produces a great variety of compounds of very beautiful colors, known by the names of aniline purple, aniline green, violet, magenta, etc. Also called *anilia*.

Animal anæretics. See *anæretic.* —**Animal charcoal.** Same as *bone-black.* —**Animal economy,** the physiological course of events in the life of an animal; the sequence of cause and effect observed in the vital activities of animals; the order of animated nature. —**Animal electricity,** electricity generated in animal bodies, as, in large quantities, in the electric eel, the torpedo, and *Malapterurus*, or, in small quantities, in nervous, muscular, and other tissues. —**Animal food,** flesh or any other part of an animal which is eaten. —**Animal force.** See *force.* —**Animal function,** any vital activity or physiological process performed in animal economy; any organic property or character of animals. Such functions may be grouped in a few broad classes: (1) Mentality, including all activities of the mind as distinguished from those of the body, such as instinct, reason, intellection, ideation, etc. (2) Sensibility, or feeling; the capability of responding automatically to external stimuli; irritability; innervation: common to all animals in a high degree as compared with plants. (3) Locomotion, usual in animals, but unusual in plants. (4) Nutrition, involving interstitial growth and waste and repair: common to plants and animals, but usually differently effected in the two, and with different material. (5) Reproduction, or generation, a process whereby growth is devoted to the formation of separate individuals. Functions shared by all organized beings are called *organic* or *vegetative* functions; no functions are peculiar to animals except those of mentality. Other lesser categories of functions are sometimes named: as, the *digestive* function; the *sexual* function; the function of *circulation*, of *respiration;* the function of the liver, or of any part or organ, that is, the special part which it takes in the animal economy. —**Animal heat,** the temperature maintained during life in an animal body, and requisite for its physiological functions. It varies from a degree not appreciably different from that of the element in which the animal lives to one much higher, the latter being the case with the higher animals. Difference in degree of animal heat is the ground of a division of the higher animals into warm-blooded and cold-blooded, or *Hæmatotherma* and *Hæmatocrya.* In the former a very sensibly elevated temperature is maintained. It is highest in birds, mounting sometimes to 112° F. In mammals a usual range is from 96° to 104° F. In man the mean normal temperature is about 99°, any considerable deviation from which is inconsistent with health. Animal heat is simply a case of chemical combustion; an analogous process goes on in plants. It is an index of the molecular motion of the body, and a measure of the work done by an animal in its vital activities. —**Animal kingdom,** all animals collectively; *Animalia;* one of the three grand divisions of the realm of nature (*imperium naturæ*), the other two comprising plants and minerals respectively. For scientific purposes it has been divided into classes, orders, families, genera, species, and groups (with intermediate divisions often formed by prefixing *sub-* or *super-* to these words), whereby the classification and registration of animals are facilitated. Examples of the primary divisions are the following: (1) The Linnean system (1766) divided animals into 6 classes: I. *Mammalia;* II. *Aves;* III. *Amphibia;* IV. *Pisces;* V. *Insecta;* VI. *Vermes.* (2) The system of Cuvier (1817) proposed 4 subkingdoms and 20 classes: I. *Vertebrata* (*Mammalia, Aves, Reptilia, Pisces*); II. *Mollusca* (*Cephalopoda, Pteropoda, Gasteropoda, Acephala, Brachiopoda, Cirrhopoda*); III. *Articulata* (*Annelides, Crustacea, Trilobita, Arachnida, Insecta*); IV. *Radiata* (*Echinodermata, Entozoa, Acalepha, Polypi, Infusoria*). (3) The system of Owen (1860) separated the *Protozoa* from *Animalia* proper as a separate kingdom, the latter being then divided into subkingdom I., *Invertebrata*, with 3 provinces, *Radiata, Articulata, Mollusca;* and subkingdom II., *Vertebrata.* (4) In 1869 Huxley arranged the animal kingdom in the 8 primary groups *Vertebrata, Mollusca, Molluscoida, Cœlenterata, Annulosa, Annuloida, Infusoria, Protozoa.* No two authorities agree upon the leading divisions of the animal kingdom, but a system like the following is now quite generally accepted: Subkingdom A (with one phylum), *Protozoa:* class I., *Rhizopoda;* class II., *Gregarinida;* class III., *Infusoria.* Subkingdom B, *Metazoa.* Phylum 1, *Cœlenterata:* class IV., *Spongiozoa;* class V., *Hydrozoa;* class VI., *Actinozoa;* class VII., *Ctenozoa.* Phylum 2, *Echinodermata:* class VIII., *Crinoidea;* class IX., *Asteroidea;* class X., *Echinoidea;* class XI., *Holothuroidea.* Phylum 3, *Vermes:* class XII., *Plathelminthes;* class XIII., *Nemathelminthes;* class XIV., *Gephyrea;* class XV., *Annelida;* class XVI., *Rotifera.* Phylum 4, *Arthropoda:* class XVII., *Crustacea;* class XVIII., *Arachnida;* class XIX., *Myriapoda;* class XX., *Insecta.* Phylum 5, *Molluscoidea:* class XXI., *Polyzoa;* class XXII., *Brachiopoda.* Phylum 6, *Mollusca:* class XXIII., *Acephala;* class XXIV., *Pteropoda;* class XXV., *Gasteropoda;* class XXVI., *Cephalopoda.* Phylum 7, *Vertebrata:* class XXVII., *Tunicata;* class XXVIII., *Leptocardia;* class XXIX., *Marsipobranchii;* class XXX., *Elasmobranchii;* class XXXI., *Pisces;* class XXXII., *Amphibia;* class XXXIII., *Reptilia;* class XXXIV., *Aves;* class XXXV., *Mammalia.* Three remarkable genera, *Dicyema, Sagitta,* and *Balanoglossus,* are severally regarded by many authors as types of classes. —**Animal magnetism, mechanics,** etc. See the nouns. —**Animal power,** the unit of power in men and animals, as *man-power, horse-power,* etc. Usually expressed in foot-pounds. See *horse-power.* —**Animal spirits.** (*a*) According to the doctrine of Galen, modified by Descartes, subtile and almost incorporeal parts of the living body, which penetrate the pores of the nerves and pass between the brain and the periphery, acting as the agents of volition and sensation. Also in the singular, *animal spirit,* equivalent to nervous force or action. (*b*) In modern use, exuberance of health and life; natural buoyancy; cheerfulness, animation, gaiety, and good humor.

Animal spirits constitute the power of the present, and their feats are like the structure of a pyramid.
Emerson, Society and Solitude.

II. *n.* **1.** A sentient living being; an individual, organized, animated, and sentient portion of matter; in *zoöl.*, one of the *Animalia;* a member of the animal kingdom, as distinguished from a vegetable or a mineral. The distinction from the latter is sufficient, consisting in organization, interstitial nutrition, vitality, and animation; but it is impossible to draw any line between all vegetables and all animals. Any criteria which may be diagnostic in most instances fail of applicability to the lowest forms of animal and vegetable life; and no definition which has been attempted has been entirely successful. Most animals are locomotory as well as motile; most plants are fixed. Most animals exhibit distinct active and apparently conscious or voluntary movements in response to irritation, mechanical or other; most plants do not. Most animals feed upon other animals or upon plants, that is to say, upon organic matter; most plants, upon inorganic substances. Most animals have no cellulose in their composition, nitrogenous compounds prevailing; while cellulose is highly characteristic of plants. Most animals inhale oxygen and exhale carbon dioxid, the reverse of the usual process in plants; and few animals have chlorophyl, which is so generally present in plants. Animals have usually a digestive cavity and a nervous system, and are capable of certain manifestations of consciousness, sentiency, and volition, which can be attributed to plants only by great latitude in the use of the terms. See also extract.

Ordinary *animals* . . . not only possess conspicuous locomotive activity, but their parts readily alter their form or position when irritated. Their nutriment, consisting of other *animals* and of plants, is taken in the solid form into a digestive cavity. . . . Traced down to their lowest terms, the series of plant forms gradually lose more and more of their distinctive vegetable features, while the series of animal forms part with more and more of their distinctive animal characters, and the two series converge to a common term. . . . The most characteristic morphological peculiarity of the *animal* is the absence of any such cellulose investment [of the cells as plants possess]. The most characteristic physiological peculiarity of the *animal* is its want of power to manufacture protein out of simpler compounds. *Huxley*, Anat. Invert., pp. 43–47.

(*b*) *Animation, Life, Liveliness, Vivacity, Spirit, Sprightliness, Gaiety*, buoyancy, cheerfulness, energy, ardor. The first four words indicate, by derivation, a full possession of the faculties of life; therefore they are the opposite of deadness or of any semblance of lifelessness. The same idea appears in the next two under the notion of the possession of the breath of life. *Animation* applies broadly to manner, looks, and language: as, *animation* of countenance; he spoke with *animation*; it implies, perhaps, more warmth of feeling than the others. *Life* is not expressive of feeling, but of full vital force and any form of its manifestation: as, his words were instinct with *life*; his delivery lacked *life*. *Liveliness* is primarily suggestive of the energetic exercise of the powers of life in alertness of mind, freshness of interest, etc. *Vivacity* applies especially to conversation, but is used also of manner and looks; it belongs mostly to externals. *Spirit* is variously compounded of courage, vigor, firmness, enthusiasm, and zeal, according to the connection; it implies the best qualities of the manly man in action. *Sprightliness* is vivacity with mirth or gaiety; it is lighter than *spirit*. *Gaiety* is the overflow of animal spirits in talk and laughter promoted by social intercourse, festivity, dancing, etc. See *mirth, hilarity, gladness, happiness.*

Pg. *anime* (NL. *anime, animi*, also *anijmum*), applied in the middle of the 16th century, and prob. earlier, to a gum brought from the East by the Portuguese; afterward applied to a similar product from the West Indies. The word, which has not been found native in the East or elsewhere, is said by Ray and others to be a Portuguese corruption of *aminæa*, Gr. *ἀμιναία* (Dioscorides), a resinous gum, this name being appar. an adj. (sc. *σμύρνα*, myrrh), referring to a people of Arabia bordering on the Red Sea, from whom the gum was obtained. *Elemi* is a different word.] **1.** The name of various resins, also known in pharmacy as *elemi* (which see).—**2.** A kind of copal, the produce principally of a leguminous tree, *Trachylobium Hornemannianum*, of Zanzibar. animism (an'i-mizm), *n.* [= F. *animisme;* < L. *anima*, soul (see *anima*), + *-ism.*] **1.** The hypothesis, original with Pythagoras and Plato, of a force (*anima mundi*, or soul of the world) immaterial but inseparable from matter, and giving to matter its form and movements.—**2.** The theory of vital action and of disease propounded by the German chemist G. E. Stahl (1660–1734); the theory that the soul (*anima*) is the vital principle, the source of both the normal and the abnormal phenomena of life. In Stahl's theory the soul is regarded as the principle of life, and, in its normal action, of health; the body being supposed to be incapable of self-movement, and not only originally formed by the soul, but also set in motion and governed by it. Hence it was inferred that the source of disease is in some hindrance to the full and free activity of the soul, and that medical treatment should be confined to an attempt to remove such hindrances from it.

3. The general conception of or the belief in souls and other spiritual beings; the explanation of all the phenomena in nature not due to obvious material causes by attributing them to spiritual agency. Among the beliefs most characteristic of animism is that of a human apparitional soul, that is, of a vital and animating principle residing in the body, but distinct from it, bearing its form and appearance, but wanting its material and solid substance. At an early stage in the development of philosophy and religion events are frequently ascribed to agencies analogous to human souls, or to the spirits of the deceased.

Spiritual philosophy has influenced every province of human thought; and the history of *animism*, once clearly traced, would record the development, not of religion only, but of philosophy, science, and literature.
Encyc. Brit., II. 57.

The theory of *Animism* divides into two great dogmas, forming parts of one consistent doctrine; first, concerning souls of individual creatures, capable of continued existence after the death or destruction of the body; second, concerning other spirits, upward to the rank of powerful deities. *E. =**Syn. 2.** *Animosity, Ill-will, Enmity, Malice, Hostility, Hatred, Hate, Malevolence, Malignity, Rancor, Grudge, Spite.* These words differ from those described under *acrimony, anger*, and *antipathy* (which see) in that they represent deeper feelings or more permanent passions. *Ill-will* may represent the minimum of feeling, being a willing or wishing of ill to another, generally without disposition to be active in bringing the evil about. *Enmity* is a somewhat stronger feeling, and it often gratifies itself in trifling and cowardly ways. *Animosity* is more intense than *enmity;* it is avowed and active, and what it does is more serious than the covert attacks of *enmity* or the hasty attacks of *spite. Malice* is pure badness of heart, delighting in harm to others for its own sake. *Hostility* is less passionate than *animosity*, but not less avowed or active, being a state of mind inclining one to aggressive warfare. *Hatred* and *hate* are the general words to cover all these feelings; they may also be ultimate, expressing the concentration of the whole nature in an intense ill-will. *Malevolence* is more casual and temporary than *malice*, arising upon occasion furnished, and characterized by a wish that evil may befall another rather than by an intention to injure. *Malignity* is malice intensified; it is hatred in its aspect of destructiveness or desire to strike at the most vital interests of another. *Rancor* is hatred or malice turned sour or bitter; it is implacable in its vindictiveness. A *grudge* is a feeling of sullen ill-will or enmity, caused by a trifling wrong, and likely to be appeased when it has spent itself in a similar return against the offender. *Spite* is sudden, resentful, and generally quite as well pleased to mortify as to damage another; it may be as strong as malice or as weak as pique.

The personal *animosity* of a most ingenious man was the real cause of the utter destruction of Warburton's critical reputation. *I. D'Israeli*, Lit. Quar., p. 397.

annealing (a-nē′ling), *n.* [Early mod. E. also *anealing*; verbal n. of *anneal*[1].] **1.** The process or art of treating substances by means of heat, so as to remove their brittleness and at the same time render them tougher and more elastic. In general, these results are obtained by heating to a high temperature and then cooling very gradu-

ally. All glassware, china, etc., which is to be subjected to great changes of temperature should be thus treated. The working of iron and steel by hammering, bending, rolling, drawing, etc., tends to harden them and make them brittle, and the original properties are restored by annealing. Steel plates and dies for bank-note printing and the like are annealed in a close box with iron filings or turnings, lime, or other substances, and are thus freed from carbon and reduced to pure soft iron, in which state they will readily take, under pressure, the finest engraving from a hardened plate or die. They are then hardened again to the degree necessary for their use in printing. Steel for engraving dies is commonly annealed by heating it to a bright cherry-red color, and cooling it gradually in a bed of charcoal.

(with single *l* after F. *annelés,* pp. pl., ringed), prop. *Annellida,* < L. *annellus,* more correctly *ānellus,* dim. of *ānulus,* a ring (see *annulus*), + *-ida.*] 1. The annelids or *Annelides,* a class of invertebrate animals, of the phylum *Vermes,* sometimes called the class of red-blooded worms. The body is composed of numerous (up to some 400) segments, somites, or metameres, and limbs are wanting, or, if present, are rudimentary and consist of the cilia or setæ known as parapodia. A vascular system with red blood is usually present; the integument is soft, and composed of many layers, the surface being mostly ciliate or setose; the head is wanting or rudimentary, and in the latter case consists of a prostomium which may be cirriferous or tentaculiferous. The *Annelida* are the "worms," properly so called, of which the common earthworm, lobworm, and leech are characteristic examples. Most of the species are aquatic and marine. The class is differently limited by different authors, the principal variation among later writers, however, being in excluding or including the *Gephyrea.* Excluding these, as is done by the above definition, the *Annelida* have been divided into four orders: (1) *Hirudinea, Discophora,* or *Suctoria,* the leeches; (2) *Oligochæta, Abranchia, Terricolæ,* etc., the earthworms and their immediate allies; (3) *Chætopoda, Polychæta, Errantia,* etc., the free sea-worms; and (4) *Cephalobranchia, Tubicolæ,* etc., the tubicolous sea-worms. Another scheme divides *Annelida* into four subclasses: (1) *Archiannelida,* composed of the genus *Polygordius* and its allies; (2) *Chætopoda,* including (2), (3), and (4) of the foregoing schedule; (3) *Hirudinea* or *Discophora;* and (4) *Enteropneusta,* consisting of the genus *Balanoglossus,* which some authorities class with the ascidians or *Chordata*.

2. In Huxley's system (1877), a superordinal division including the *Polychæta, Oligochæta, Hirudinea,* and *Gephyrea,* with the *Myzostomata* doubtfully added thereto: a group the members of which resemble one another generally in the segmentation of the body indicated at least by the serially multiganglionate nervous centers (wanting in most *Gephyrea*), in the presence of cilia and segmental organs, and in the nature of the larvæ, which are set free when the embryos hatch.

ant[1] (ȧnt), *n.* [Early mod. E. *ante, ampte*, < ME. *amte, amete*, < AS. *ǣmete, ǣmette* (also **ēmete*, > ME. *emete, emette, emet*, E. *emmet*, q. v.) = OHG. *āmeiza*, MHG. *ameize*, G. *ameise* (MHG. also *emeze*, G. *emse*), ant. Of uncertain origin; perhaps < AS. *ā-*, E. *a-*[1] (also found accented in AS. *ā-cumba*, E. *oakum*), + **mǣtan* (in deriv. *mettan*, (cut, engrave, hence) paint, depict; cf. *metere*, a stone-cutter, and G. *stein-metz*, a stone-cutter) = OHG. *meizan*, MHG. *meizen*, = Icel. *meita*, cut. The lit. sense would then be 'the cutter or biter off'; unless the term be taken passively, in a sense like that of Gr. ἔντομον or L. *insectum*, insect, lit. 'cut in.' The G. form is commonly referred (through MHG. *emeze*, G. *emse*) to G. *emsig*, MHG. *emzic*, OHG. *emizzig, emazzig*, industrious, assiduous, which agrees formally, but not in sense, with AS. *æmetig, emtig*, E. *empty*, q. v. See *mire*[2] and *pismire*.] An emmet; a hymenopterous insect of the family *Formicidæ* and the Linnean genus *Formica*, now divided into several genera. Ants live in communities, and the internal economy of their nest or hillock presents an extraordinary example of the results of combined industry. Each community comprises males with four wings, females much larger than the males and possessing wings during the pairing season only, and barren females, called neuters, workers, or nurses, destitute of wings. The females lay their eggs in parcels of six or more. The males and females desert the nest and copulate soon after becoming perfect; but the latter are

brought back by the workers, or else found new colonies, with or without help. The male, like the drone-bee, becomes useless after impregnating the female. The grubs spin a cocoon, and become pupæ, which resemble barley-corns, and are popularly taken for eggs. Under the names of *ants' brood, ants' eggs*, they are an article of import in some northern countries for making formic acid; a solution of them in water is used for vinegar in Norway. The young grubs are fed by the females and by the nurses, who also construct the streets and galleries of the colony, and in general perform all the work of the community. There are many kinds of ants, called from the operations they perform mining-ants, carpenters, masons, etc. The favorite food of ants is honey, particularly the honey-dew excreted by aphids; but they also live on fruits, insects and their larvæ, and dead birds and mammals. They are torpid in winter. Those of the same or different species engage in pitched battles, and capture slaves or take larvæ from other nests. Some species have stings, others squirt out an irritant fluid (formic acid). See cut under *Atta*. The name *ant*, or *white ant*, is also given to insects of the neuropterous genus *Termes*. See *termite*.

(*b*) In *Arachnida*, or spiders, scorpions, etc., a chelicere; one of the pair of chelate or subchelate appendages of the head, situated between and morphologically in front of the large hooked or pincer-like appendages known as pedipalps. They are adapted for seizing and tearing, and sometimes convey a poison-duct. They are homologous with the feelers of crustaceans and insects, and are supposed, in some cases at least, to represent antennulæ as well as antennæ proper. See cuts under *chelicera* and *scorpion*. (*c*) In *Insecta* and *Myriapoda*, a horn or feeler; one of the pair of jointed flexible sensitive appendages of the head, morphologically situated between the mouth-parts and the eyes, though generally appearing in the adult between or before the eyes. These characteristic organs are usually filamentous with many articulations, and are very diverse in form; some of the terms used in describing their shapes are filiform, denticulate, bipinnate, clavate, geniculate. In *Coleoptera*, divisions have been founded upon the shapes of the antennæ, as lamellicorn, clavicorn, longicorn, etc. These organs are almost universally present in some form or other, though occasionally rudimentary and inconspicuous, in which cases the insects are termed *acerous*, as distinguished from *dicerous*. The parts of a well-formed antenna usually recognized are the pedicel, scape, and flagellum or claveola, the last usually composing most of the length of the organ. See *Hymenoptera*, *Insecta*.

OS. AS., etc., *and-*: see further under *ante-* and *and-.* In a few words *anti-* represents L. *ante, anti-,* as in *anticipate, antibrachial.*] A prefix of Greek origin: originally only in compounds or derivatives taken from the Greek or formed of Greek elements, as in *antipathy, antinomy,* etc. (the earliest example in English being *antichrist,* which see), but now a familiar English formative, meaning primarily against, opposed to. It forms—(1) Compound nouns (with the accent on the prefix), in which *anti-* has the attributive force of opposed to, opponent, opposite, counter, as in *antichrist, antipope, antichorus, anticyclone, antipole,* etc. (2) Compound adjectives (with the accent on the radical element), in which *anti-* retains its original prepositional force, against, opposed to, governing the noun expressed or implied, as in *antichristian, antipapal, anticlerical,* etc. Such compound adjectives adopt an adjective termination, as in the examples just cited, or omit it, as in *antichurch, antislavery, antiprohibition, antirent,* when it does not exist or is not readily formed. This mixture of adjective and substantive forms makes easy the development, from the compound adjectives, of abstract nouns like *antislavery, antiprohibition,* etc. In form these compound adjectives, like *antichristian, anticlerical, anti-Socinian,* are thus, strictly, made up of *anti-* with a noun and an adjective termination, as *anti-* + *Christ* + *-ian, anti-* + *cleric* + *-al, anti-* + *Socin(-us)* + *-ian,* etc.; but in effect they are often equivalent to, and for brevity they may be marked as, *anti-* + *Christian, anti-* + *clerical,* etc. These compounds are especially applied to persons or parties opposed in opinion or practice to other persons or parties, or to things; in medicine, to remedies producing or intended to produce an effect or condition opposite to or in correction or prevention of that implied in the simple word, as *anticorrosive, antipyretic, antifat,* etc. In the etymologies following, *anti-* is treated as a mere English formative, and is not referred to the Greek, except when obviously taken, in connection with the radical element, directly from the Greek.

The Antiburghers denied that this oath could be taken consistently with the principles of the church, while the Burghers affirmed its compatibility. The result was that the church was rent in two, each section establishing a communion of its own, known respectively as the General Associate Synod, or Antiburghers, and the Associate Synod, or Burghers. They were reunited in 1820, after seventy-three years of separation, thus constituting the United Secession Church.

> As ye have heard that *antichrist* shall come, even now are there many *antichrists*. . . . He is *antichrist*, that denieth the Father and the Son. 1 John ii. 18, 22.

The word occurs in the Scriptures only in the Epistles of John; but the same person or power is elsewhere referred to (2 Thes. ii. 1–12; 1 Tim. iv. 1–3; 2 Pet. ii. 1). Interpreters of Scripture differ in their understanding of these references. Some suppose them to relate to a lawless but impersonal power, a spirit opposed to Christianity; some to a historic personage or potentate, as Caligula, Titus, the pope, or Luther; some to a great power for evil yet to be

manifested and gathered about a central personal agency. Roman Catholic writers commonly interpret the word generically of any adversary of Christ and of the authority of the church, but specifically as the last and greatest persecutor of the Christian church at the end of the world. The name has also been applied to the pretenders to the messiahship, or false Christs (Mat. xxiv. 24), who have arisen at various periods, as being antagonistic to the true Christ. Of these as many as sixty-four have been reckoned, including some of little importance, and also some, as Mohammed, who cannot properly be classed among them.

4. In *logic*, the term used since Cicero (Latin *anticipatio*) to translate the "prolepsis" (πρόληψις) of the Epicureans and Stoics. It denotes any general notion considered as resulting from the action of memory upon experiences more or less similar. Such a notion is called an anticipation because, once possessed, it is called up in its entirety by a mere suggestion. It thus acquaints us with what has not yet been perceived, by a reference to past perceptions. Hence, with later philosophers, the word denotes knowledge drawn from the mind, independently of experience; the knowledge of axioms or first principles. It is characterized by forked hollow horns supported upon a long bony core or osseous process of the frontal bone, as in the cattle or true hollow-horned ruminants, yet deciduous, being periodically shed and renewed like the antlers of deer. These singular horns are composed of agglutinated hairs hardening into solid corneous tissue, and when sprouting resemble the skin-covered knobs upon the head of the giraffe. There are several remarkable osteological peculiarities of the skull, among them the inclosure of the styloid process of the temporal bone in a sheath formed by an extension of the external auditory meatus.

In these *antilogies* and apologies, however, a difference might be perceived: and some of the advocates of Henry appeared less anxious to attack Rome than to defend their prince. *R. W. Dixon*, Hist. Church of Eng., vi.

Antilope (an-til'ō-pē), *n.* [NL.: see *antelope*.] **1.** A genus of *Antilopinæ* (which see). The term has been used with such latitude in its application to the whole of the group *Antilopinæ*, and, when restricted, has been employed in so many different senses, that it has lost whatever exact meaning it may have possessed originally, and has become a loose, fluctuating synonym of the subfamily name *Antilopinæ*. Even in early usage it appears to have been applied to several different small gazel-like antelopes. It is now commonly restricted to the sasin or Indian antelope, *Antilope cervicapra*. See cut under *sasin*.

2† (an'ti-lōp). [*l. c.*] Obsolete (English) spelling of *antelope*.

Antilopidæ (an-ti-lop'i-dē), *n. pl.* [NL., < *Antilope* + *-idæ*.] A family of ruminants; the antelopes: sometimes used as a synonym of *Antilopinæ*. Also written *Antelopidæ*.

Antilopinæ (an″ti-lō-pī'nē), *n. pl.* [NL., < *Antilope* + *-inæ*.] A subfamily of old-world and chiefly African ruminants, the antelopes, a group belonging to the family *Bovidæ*. They differ from cattle in their smaller size, more lithe and graceful form, slenderer legs, which are comparatively longer in the shank, and longer neck, with slenderer vertebræ, uplifting the head. The *Antilopinæ* shade directly into the sheep and goats (*Ovinæ* and *Caprinæ*), being separable from them by no technical character; but the horns usually differ from the forms presented by goats and sheep, though they are so diverse as to be definable by no common character. *Antilopinæ* are specially numerous in species and individuals in Africa, of which continent they are the most characteristic animals. Upward of 50 African species have been described; there are many others in Asia, and a few in Europe. Some 75 species are recognized by naturalists, but probably the number of genuine species is less than this. Several hundred different names, generic, specific, and vernacular, have been applied to these animals; and no authors except mere compilers are agreed upon the division of the group. The antelopes present the utmost diversity of stature, form, and general appearance, ranging from the smallest and most delicate gazels, steinboks, and springboks to the bulky eland, nylghau, or hartbeest, as large as a cow, horse, or stag, and include the singularly misshapen gnu (*Connochætes gnu*). The Rocky Mountain goat, *Haplocerus montanus*, related to the Alpine chamois, *Rupicapra tragus*, and the goral, *Nemorhedus goral*, another goat-like antelope, are also placed in this subfamily. The bubaline or bovine antelopes include the hartbeest (*Alcelaphus caama*), blesbok (*A. albifrons*), and bontebok (*A. pygargus*). Four-horned antelopes belong to the genus *Tetraceros*. The philantomba and coquetoon antelopes, the blauwbok, duyker, etc., are placed in the genus *Cephalophus*. The steinboks are species of *Neotragus*; the singsing, kobus, leche, bohor, etc., are of the genera *Cervicapra*, *Kobus*, and their immediate allies. The gazels are a large group, constituting the genus *Gazella* (or *Dorcas*) and others; they include the springbok (*Antidorcas euchore*), and are Indian, Arabian, and Syrian, as well as African. The sable or equine antelopes constitute the genus *Hippotragus*. The addax is *Addax nasomaculatus*. There are several species of *Oryx*, as *O. leucoryx*. The nylghau is *Boselaphus tragocamelus*. The harnessed antelopes (so called from the stripes on the sides), or the boschboks, are species of *Tragelaphus*, as *T. scriptus*, *T. sylvaticus*. The koodoo is a large antelope with twisted horns (*Strepsiceros kudu*). The eland is *Oreas canna*. The so-called saiga antelope is the type of a different family, *Saigidæ* (which see); the American antelope also belongs to a different family, *Antilocapridæ* (which see). See cuts under *addax*, *eland*, *gazel*, *gnu*, and *Haplocerus*. Also written *Antelopinæ*.

S. hist.*, a political party which originated in New York State about 1827, in the excitement caused by the supposed murder of William Morgan, of Batavia, New York, in 1826, by freemasons, to prevent a threatened public disclosure of the secrets of their order. The movement spread to some other States, and a national party was organized, but within about ten years it disappeared, most of the Antimasons becoming Whigs. Its characteristic tenet was that freemasons ought to be excluded from public office, because they would necessarily regard their obligations to the society more than their obligations to the state. Its principles were revived in a so-called "American party" organized in 1875.

Ch.*, a consecrated cloth on which the eucharist is consecrated in places where there is no consecrated altar. It takes the place of the portable altar of the Latin Church. The term is sometimes extended in the Syrian churches to a thin slab of wood consecrated for a like purpose. Also written *antiminsion.*

antimere (an′ti-mēr), *n.* [< Gr. *ἀντί*, against, + *μέρος*, a part.] In *biol.*, a segment or division of the body in the direction of one of the secondary or transverse axes, all of which are at right angles to the primary or longitudinal axis. When these axes are not differentiated in any way, all antimeres are alike, and are parts arranged around the long prime axis like the spokes and fellies of a wheel around the axis of the hub: a disposition preserved with much accuracy in many of the *Radiata*, among which, for example, the arms of a starfish, the tentacles of a sea-anemone or coral-animalcule, or the rows of ambulacra of a sea-urchin are antimeres. Oftener, however, the transverse axes are differentiated, some being shorter, others longer, giving rise to sides, as right and left, in the direction of the longer transverse axes, in which case right and left parts are antimeres. This constitutes bilateral symmetry. Parts which may be perceived to correspond at opposite poles of the other (shorter) transverse axes, constituting dorsabdominal symmetry, are also antimeres; but this condition is obscure. Likewise, again, parts along the primary longitudinal axis, or at its poles, which may be observed or be conceived to constitute anteroposterior symmetry, are essentially antimeric; but this condition, like dorsabdominal symmetry, is obscure, while the serial succession of like parts along the prime axis, as the rings of a worm, crustacean, or insect, and the double rings of a vertebrate, is so marked that antimeres of this kind are not called antimeres, but *metameres;* such are the ordinary segments, somites, arthromeres, or diarthromeres of any articulate or vertebrate animal. Antimere is therefore practically restricted to such radiating and bilateral parts as are more or less symmetrical with one another. See *eudipleural.*

★**antimony** (an′ti-mō-ni), *n.* [< late ME. *antimony* = OF. *antimonie*, mod. F. *antimoine* = Sp. Pg. It. *antimonio* = Sw. Dan. G. *antimonium* = Russ. *antimoniya* = Pol. *antymonium*, etc., < ML. *antimonium*, antimony, a word of unknown origin, simulating a Gr. appearance, perhaps a perversion, through such simulation (*antimonium*, < **atimonium*, < **atimodium*, < **athimodium*?), of the Ar. name (with art. *al-*?) *ethmad, othmod, uthmud*, earlier *ithmid*, antimony, which is in turn perhaps an accommodation (through **isthimmid*?) of Gr. *στιμμί-*, one of the stems of *στίμμι* (*στιμμι-, στιμμε-, στιμμιδ-*), also *στῖμι* and *στίβι* (**στῖβι*?), > L. *stimmi, stibi*, and *stibium*, antimony, the Gr. name itself being appar. of foreign or Eastern origin: see *stibium.* False etymologies formerly current are: (1) < F. *antimoine*, < Gr. *ἀντί*, against, + *moine*, a monk, as if 'monk's bane'; (2) < Gr. *ἀντί*, against, + *μόνος*, alone, as if never found alone; (3) < Gr. *ἀντί*, instead of, + L. *minium*, red lead, "because women used it instead of red lead" as an eye-paint.] Chemical symbol, Sb (Latin *stibium*); atomic weight, 120.2. A metal of a white color and bright luster which does not readily tarnish, having a specific gravity of 6.7, crystallizing in the rhombohedral system, and in the mass ordinarily showing a crystalline structure and highly perfect cleavage. It conducts both heat and electricity with some readiness, but less perfectly than the true metals, and differs from them also in being brittle like arsenic. It melts at 430° C. (806° F.), and volatilizes slowly at a red heat; when melted in the air it oxidizes readily, forming antimony trioxid, Sb_2O_3. Antimony occurs uncombined in nature to a limited extent, usually in granular or foliated masses, often with a botryoidal or reniform surface. Many compounds of antimony are found in nature, the most important of them being the sulphid, Sb_2S_3, called gray antimony, antimony-glance, or stibnite. Dyscrasite is a compound of antimony and silver. There are also a number of minerals containing antimony, sulphur, and lead (like jamesonite), or antimony, sulphur, and silver (like pyrargyrite or ruby silver), or antimony, sulphur, and copper (like tetrahedrite). The oxisulphid kermesite or red antimony and the oxids cervantite and stibiconite (antimony ocher) are also important minerals. Antimony has few uses in the arts; it enters, however, into a number of very valuable alloys, as type-metal, pewter, Britannia metal, and Babbitt metal, and is used in medicine. Tartar emetic is the tartrate of antimony and potassium. James's powder is a mixture of oxid of antimony and phosphate of lime.—**Antimony vermilion**, a sulphid of antimony suggested but never used as a pigment.—**Argentine flowers of antimony**, the tetroxid of antimony.—**Arsenical antimony.** See *allemontite.*—**Black antimony**, antimonious sulphid.—**Butter of antimony.** See *butter*[1].—**Ceruse of antimony.** See *ceruse.*—**Diaphoretic antimony**, a preparation chiefly consisting of potassium antimoniate, made by exposing the neutral antimoniate to the action of carbonic-acid gas, or by deflagrating pure antimony with potassium nitrate. It is used in the manufacture of enamels, and was formerly administered as a medicine.—**Glass of antimony.** See *glass.*—**Red antimony ore**, an oxisulphid of antimony. Same as *kermesite.*—**White antimony**, or **antimony white**, native antimony trioxid, Sb_2O_3.—**Yellow antimony**, or **antimony yellow**, a preparation of the oxids of lead and antimony, of a deep-yellow color, used in enamel- and porcelain-painting. It is of various tints, and the brilliancy of the brighter hues is not affected by foul air.

II. *n.* In *theol.*, one who maintains that Christians are freed from the moral law as set forth in the Old Testament by the new dispensation of grace as set forth in the gospel; an opponent of legalism in morals. Antinomianism has existed in three forms: in the early church, as a species of Gnosticism, in the doctrine that sin is an incident of the body, and that a regenerate soul cannot sin; later, in the Reformation, as a reaction against the doctrine of good works in the Roman Catholic Church, in the antagonistic doctrine that man is saved by faith alone, regardless of his obedience to or disobedience of the moral law as a rule of life; finally, as a phase of extreme Calvinism, in English Puritan theology, in the doctrine that the sins of the elect are so transferred to Christ that they become his transgressions and cease to be the transgressions of the actual sinner. The chief exponent of the second form of antinomianism was John Agricola (Germany, 1492–1566); the chief exponent of the third, Tobias Crisp, D. D. (England, 1600–1642). [Often with a capital.]

2. Any law, rule, or principle opposed to another.

=**Syn.** *Hatred, Dislike, Antipathy, Disgust, Aversion, Reluctance, Repugnance.* *Hatred* is the deepest and most

permanent of these feelings; it is rarely used except of persons. *Dislike* is the most general word, and depends upon the connection for its strength; it is opposed to *liking* or *fondness*. *Antipathy* expresses most of constitutional feeling and least of volition: the turkey-cock has an *antipathy* to the color red; many people have an intense *antipathy* to snakes, rats, toads. In figurative use, *antipathy* is a dislike that seems constitutional toward persons, things, conduct, etc.; hence it involves a dislike for which sometimes no good reason can be given. *Antipathy* is opposed primarily to *sympathy*, but often to mere *liking*. *Disgust* is the loathing, first of physical taste, then of esthetic taste, then of spiritual taste or moral feeling. *Aversion* is a fixed disposition to avoid something which displeases, disturbs, or annoys: as, quiet people have an *aversion* to noise. It is a dislike, settled and generally strong. *Reluctance* and *repugnance* by derivation imply a natural struggle, as of hesitation or recoil; with *reluctance* it is simply the will holding back in dislike of some proposed act, while with *repugnance* it is a greater resistance or one accompanied with greater feeling, and generally in regard to an act, course, idea, etc., rarely to persons or things. See *animosity*.

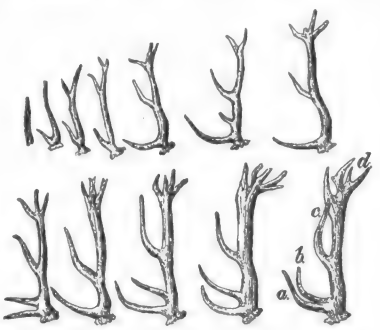
(See below.)—**3.** Now, when used absolutely, one of the solid deciduous horns of the *Cervidæ*, or deer family, which are periodically shed and renewed, as distinguished from the permanent hollow horns of other ruminants. Antlers are of all shapes and sizes, from the short simple spikes of some species to the enormous branched or palmate antlers of the stag, elk, or moose. They are secondary sexual organs, developed in connection with the rut, and generally only in the male sex; in some *Cervidæ*, as reindeer, in both sexes. They consist of a modification of true bone, and are therefore radically different from the cuticular or epidermal structures (horns) of other ruminants. During growth they are covered with a modified periosteal and epidermal tissue, abounding in blood-vessels, and furry outside; this is



Stag's Antler in successive years.
a, brow-antler; *b*, bez-antler; *c*, antler royal; *d*, sur-royal, or crown-antler.

the velvet, affording a copious supply of blood to the rapidly enlarging osseous tissue. When the antlers are full-grown the vascular activity of the velvet ceases, a result mechanically facilitated by the development of the boss or bur at the root of the beam, which to some extent strangulates the blood-vessels. The velvet then withers and shrivels, and peels off in shreds, or is rubbed off by the animal. The horns of the American prongbuck are antlers, inasmuch as they are deciduous and grow in the manner just described; but they are cuticular structures, and otherwise like the horns of cattle. In forestry, the tines of much-branched antlers, as those of the stag, have special names. In the first year the stag has only frontal protuberances, called *bossets;* in the second, a simple *stem* or *snag*, called *spike* in the case of American deer; in the third, a longer stem with one branch, the *brow-antler;* in the fourth, the *bez-*, *bes-*, or *bay-antler;* in the fifth, the *antler royal* is acquired; after which the ends of the stag's horns become more or less palmate, developing the *crown* or *sur-royal*, whence more or fewer points diverge in subsequent years. The total number of 'points,' counting all the tines, may be ten. The main stem of a branched antler is the *beam;* the branches, exclusive of the mere points of the palmated part, are the *tines.* The order of branching is different in different species; in some the division is dichotomous throughout, as in the mule-deer of America. In general, the tines are offsets of a main beam. The reindeer is remarkable for the great size of the brow-antler, which is also usually much larger on one side than on the other. The most palmate antlers are those of the European elk and of the American moose.

★**aorta** (ā-ôr′tä), *n.*; pl. *aortæ* (-tē). [NL., < Gr. ἀορτή, aorta, < ἀείρειν, raise, lift, pass. ἀείρεσθαι, rise. Cf. *artery*.] In *anat.*, the main trunk of the arterial system, issuing from the left ventricle of the heart, conveying arterialized blood to all parts of the body except the lungs, and giving rise, directly or indirectly, to all the arteries of the body except the pulmonary. The name is chiefly given to such an artery in those higher vertebrates which have a completely four-chambered heart. The aorta commonly gives off immediately the great vessels of the head, neck, and anterior limbs, and ends by forking to supply the posterior limbs. In the embryo it communicates with the pulmonary artery by a duct (ductus arteriosus), which is normally closed at birth. In man the aorta is divided into *ascending*, *transverse*, and *descending* portions. The *ascending* aorta rises and then curves over to the left, forming the *transverse* portion or *arch of the aorta*, whence spring the innominate and left carotid and left subclavian arteries; it then descends upon and a little to the left of the bodies of the vertebræ, forming the *descending* aorta, divided into the *thoracic* aorta above the diaphragm and the *abdominal* aorta below it; it ends usually opposite the fourth lumbar vertebra by bifurcating into the right and left common iliac arteries. The thoracic branches are numerous, but small and chiefly intercostal; the abdominal branches are the cœliac, superior and inferior mesenteric, renal, suprarenal, spermatic, and others. The aorta is provided at its beginning with three semilunar valves, which prevent regurgitation of blood into the heart. See *aortic*, and cuts under *circulation*, *embryo*, *heart*, *thorax*.—**Cardiac aorta.** See extract below.—**Definitive aorta**, the aorta as defined above.—**Primitive aortæ**, the first and paired main arteries of the embryo, connected with the omphalomesenteric vessels. See extract.

The heart of the vertebrate embryo is at first a simple tube, the anterior end of which passes into a cardiac aortic trunk, while the posterior end is continuous with the great veins which bring back blood from the umbilical vesicle. The *cardiac aorta* immediately divides into two branches, each of which ascends, in the first visceral arch, in the form of a forwardly convex aortic arch, to the under side of the rudimentary spinal column, and then runs parallel with its fellow to the hinder part of the body as a *primitive* subvertebral *aorta*. The two *primitive aortæ* soon coalesce, in the greater part of their length, into one trunk, the definitive subvertebral aorta, but the aortic arches, separated by the alimentary tract, remain distinct.
Huxley, Anat. Vert., p. 90.

aortal (ā-ôr′tal), *a.* [< *aorta* + *-al*.] Same as *aortic*. [Rare.]

aortic (ā-ôr′tik), *a.* [< *aorta* + *-ic*.] Belonging or pertaining to the aorta.—**Aortic arch.** (*a*) The permanent arch of the aorta. See *aorta*. (*b*) One of the five or more pairs of arterial arches of the embryo of a vertebrate, formed by forkings of the primitive cardiac aorta, and reuniting to form the primitive and finally the definitive subvertebral aorta, or aorta proper. There is a pair of such aortic arches to each pair of visceral arches of the neck. In the higher vertebrates the two anterior pairs disappear; the third pair is modified into the carotid arteries supplying the head; the fourth pair becomes the arteries supplying the anterior limbs and the permanent arch of the aorta—in man, the innominate and right subclavian on the right side, and the left subclavian and arch of the aorta on the left; in the fifth pair in man the right side is obliterated, and the left forms the permanent pulmonary artery, the descending aorta, and the ductus arteriosus, which is the communication between the fifth and the fourth arches. In branchiate vertebrates most of these arches are permanent, becoming the blood-vessels of the gills.—**Aortic bulb**, the enlargement at the beginning of the cardiac aorta.—**Aortic compressor**, an instrument, used in amputation at the hip-joint, post-partum hemorrhage, etc., to compress the aorta, to limit the flow of blood from it to the arteries below.—**Aortic orifice**, **aortic aperture**, of the diaphragm, the hole of the diaphragm, between its right and left pillars, through which the aorta passes from the thorax into the abdomen; it also gives transit to the thoracic duct, and usually to an azygous vein.—**Aortic valves**, the three semilunar valves at the origin of the aorta from the left ventricle of the heart, guarding the orifice and preventing regurgitation into the ventricle.—**Aortic vestibule**, the part of the left ventricle adjoining the root of the aorta.

=**Syn.** *Indifference*, *Insensibility*, *Impassibility*, *Apathy*, *Stoicism*, *Unconcern*, *Phlegm*, *Calmness*, torpor, coldness, coolness, unfeelingness, lethargy, immobility. (See list under *indifference*.) *Indifference* denotes absence of feeling, passion, or desire toward a particular object: as, *indifference* to pain or ridicule. *Apathy* commonly implies a general want of feeling, a complete indifference in regard to anything, due to want of interest or attention, as in the case of a repressed or sluggish intellect, or of extreme illness or affliction. *Insensibility* and *impassibility* suggest the lack of capacity for feeling, or an absence of susceptibility, being qualities rather than states of mind. *Indifference* arising from *impassibility* relates more particularly to internal, that arising from *insensibility* to external, impressions; the former is, moreover, more profound and radical than the latter. *Indifference* may be an entirely proper state under the circumstances; *insensibility* and *impassibility* are always at least to be pitied; *unconcern* is always and *indifference* sometimes blameworthy, as cold and selfish. *Stoicism* is a studied suppression of feeling, or the concealment especially of painful feeling by force of will. *Unconcern* is absence of solicitude. (See *care*.) *Phlegm* is most suggestive of physical temperament; it is a constitutional dullness or sluggishness, an incapability of being aroused by anything. *Calmness* is a tranquillity resulting from the mastery of the will over passions and feelings that perhaps are strong and keen, and hence is always commendable.

With the instinct of long habit he turned and faced the battery of eyes with the same cold *indifference* with which he had for years encountered the half-hidden sneers of man. *Bret Harte*, Argonauts, p. 126.

Unbelief might result from the *insensibility* engendered by a profligate life.
G. P. Fisher, Begin. of Christianity, p. 139.

I threw myself on my bed, . . . resisting no longer, but awaiting my fate with the *apathy* of despair.

The victors set fire to the wigwams and the fort. . . . This last outrage overcame even the *stoicism* of the savage. *Irving*, Sketch-Book, p. 370.

Still less respectable appears this extreme concern for those of our own blood which goes along with the *unconcern* for those of other blood, when we observe its methods. *H. Spencer*, Sins of Legislators, ii.

One likes in a companion a *phlegm* which it is a triumph to disturb. *Emerson*, Clubs.

The *aphorism* . . . formulated by Linnæus in regard to plants. *Quatrefages*, Human Species (trans.), p. 50.

2. A precept or rule expressed in few words; a detached sentence containing some important truth: as, the *aphorisms* of Hippocrates, or of the civil law.

The three ancient commentators on Hippocrates . . . have given the same definition of an *aphorism*, *i. e.*, "a succinct saying, comprehending a complete statement," or a saying poor in expression, but rich in sentiment. *Fleming.*

=**Syn.** *Aphorism, Axiom, Maxim, Precept, Dictum, Apothegm, Saying, Adage, Proverb, Truism, Byword, Saw*, all concur in expressing a pithy general proposition, usually in one short sentence; but the longer the form the less applicable do these names become. An *aphorism* is a truth, pointedly set forth, relating rather to speculative principles, ethics, or science than to practical matters, and forming a brief and excellent statement of a doctrine: thus, "Moderation is the silken string running through the pearl-chain of all virtues," and "Maladies are cured by nature, not by remedies," are *aphorisms.* "Life is short, and art is long," is from the first *aphorism* of Hippocrates. An *axiom* is a self-evident truth, and is therefore used as a basis for reasoning. "A straight line is the shortest distance between two points" is one of the *axioms* of mathematics; "The greater good is to be chosen before the less" is an *axiom* of morals. The number of axioms is necessarily limited; of aphorisms, maxims, etc., unlimited. A *maxim* is a truth which, while not so definite and necessarily true as an *axiom*, yet equally acceptable to the mind, refers rather to practical than to abstract truth, stating one of the fundamental rules of conduct, civil government, business policy, and the like: as, it is a sound *maxim* that one should risk in speculation no more than he can afford to lose. It suggests a lesson more pointedly and directly than *aphorism*, and differs from *precept* in that a *precept* is a direct injunction, whereas a *maxim* is a mere statement of a truth from which a *precept* may be deduced. It would be a *precept* to say, "In speculation risk no more than you can afford to lose." A *dictum* is not a *precept*, but an opinion given with authority, as from superior knowledge: as, a *dictum* of the critics; a *dictum* of Carlyle's. An *apothegm*, in common matters what an *aphorism* is in higher, is essentially a terse proposition that makes a vivid impression on the mind: thus, "In the adversity of our best friends we always find something that doth not displease us"; this is called by Dean Swift a *maxim*, but is more properly an *apothegm.* "Heaven helps those that help themselves," and

> "He who fights and runs away
> May live to fight another day"
>
> (*Goldsmith*, Art of Poetry),

are *apothegms.* A *saying* is a lower grade of *apothegm;* each is likely to be found associated with the name of the author: as, the *apothegms* of Socrates; a *saying* of Poor Richard. Each is a felicitous expression current for its own sake, but deriving additional popularity from the celebrity of its author. "Herein is that *saying* true, One soweth, and another reapeth," John iv. 37; "The little and short *sayings* of wise and excellent men are of great value, like the dust of gold or the least sparks of the diamond," *Tillotson.* *Adage* and *proverb* are habitual sayings, generally of long standing, embodying the common sense of mankind on ordinary subjects. The *adage* is often the more venerable by age and the more dignified in its character: as, "Necessity knows no law." A *saying* may easily become an *adage.* *Proverb* as used in the Bible is often a *saying:* as, "Physician, heal thyself," Luke iv. 23; but in the mod-

ern sense *proverb* often appears in some concrete figurative and homely form: as, "Too many cooks spoil the broth"; "Every tub must stand on its own bottom." A *truism* is a truth too obvious to need explanation or proof; it is a word of relative application; what would be a *truism* to one might be an *axiom* or an *aphorism* to another. A *byword* is a cant term or phrase, in every one's mouth like a proverb, but applied in disparagement. *Saw* is a contemptuous term for an expression that is more common than wise, or for a trite or foolish saying reiterated to wearisomeness.

(*b*) In *med.*, the restoration which is indicated by the cessation or subsiding of an abscess or a tumor. The doctrine of such a restitution, founded on Acts iii. 21 and other passages of Scripture, has appeared in the Christian church at different times during the past seventeen centuries, and forms an important feature of the creed of modern Universalists. See *restitution.* Also spelled *apokatastasis.*

apocatharsis (ap″ō-ka-thär′sis), *n.* [NL., < Gr. *ἀποκάθαρσις*, that which is cleared off, < *ἀποκαθαίρειν*, clear off, cleanse, < *ἀπό*, off, + *καθαίρειν*, cleanse: see *cathartic.*] In *med.*, same as *catharsis. Dunglison.*

apochromatic (ap″ō-krō-mat′ik), *a.* [< Gr. *ἀπό*, from, + *χρῶμα*(*τ-*), color, + *-ic.*] An epithet descriptive of an improved form of lens devised by Professor Abbe of Jena, constructed of new kinds of glass which allow of a more perfect correction of chromatic and spherical aberration than has hitherto been possible. The kinds of glass employed are chiefly remarkable in that their dispersion for different parts of the spectrum is nearly proportional; hence a lens constructed of them is not subject to the limitation of an ordinary achromatic lens of being strictly achromatic for two colors only. Another defect of ordinary lenses, that their spherical aberration is not corrected for all rays, is also largely overcome.

The elimination of these errors realizes an achromatism of higher order than has hitherto been attained. The objectives of this system may be therefore distinguished from achromatic lenses in the old sense of the word by the term *apochromatism*, and may be called *apochromatic* objectives.
Jour. Roy. Micros. Soc., Feb., 1887, p. 23.

> *Locke*, Government, II. i. 11. (*N. E. D.*)

Specifically—2. *Eccles.*: (*a*) A name given in the early church to various writings of uncertain origin and authority, regarded by some as inspired, but rejected by most authorities or believers. Such books were either works acknowledged to be useful and edifying, but not established as canonical, or else heretical writings absolutely rejected by the church. (*b*) [*cap.*] A collection of fourteen books subjoined to the canonical books of the Old Testament in the authorized version of the Bible, as originally issued, but now generally omitted. They do not exist in the Hebrew Bible, but are found with others of the same character scattered through the Septuagint and Vulgate versions of the Old Testament. They are: First and Second Esdras (otherwise Third and Fourth Esdras or Ezra, reckoning Nehemiah as Second Ezra or Esdras), Tobit or Tobias, Judith, the Rest of Esther, Wisdom of Solomon, Ecclesiasticus, Baruch (as joined to Jeremiah), parts of Daniel (namely, Song of the Three Children, the History of Susanna, the Destruction of Bel and the Dragon), the Prayer of Manasses, and First and Second Maccabees. Most of these are recognized by the Roman Catholic Church as fully canonical, though theologians of that church often distinguish them as deuterocanonical, on the ground that their place in the canon was decided later than that of the other books, limiting the name Apocrypha to the two (last) books of Esdras and the Prayer of Manasses, and other books not in the above collection, namely, Third and Fourth Maccabees, a book of Enoch, an additional or 151st Psalm of David, and eighteen Psalms of Solomon. With these sometimes are included certain pseudepigraphic books, such as the Apocalypse of Baruch and the Assumption of Moses. The name Apocrypha is also occasionally made to embrace the Antilegomena of the New Testament. The Greek Church makes no distinction among the books contained in the Septuagint. In the Anglican and Lutheran churches, the Apocrypha are read for example of life and instruction of manners, but not for the establishing of any doctrine. See *antilegomena* and *deuterocanonical*.

apocryphal (a-pok′ri-fal), *a.* and *n.* [< NL. *apocryphalis*, < LL. *apocrypha*: see *apocrypha*.] **I.** *a.* 1. Of doubtful authorship, authenticity, or inspiration; spurious; fictitious; false.

Apocynaceæ (a-pos-i-nā′sē-ē), *n. pl.* [NL., < *Apocynum* + *-aceæ.*] A family of dicotyledonous plants, having for its type the genus *Apocynum*, or dogbane. It is very nearly allied to the family *Asclepiadaceæ*, from which, however, it is distinguished by the fact that its stamens are free from the style and stigma, and its anthers contain granular pollen. The species are largely tropical, and have a milky juice that is often acrid and sometimes very poisonous. India-rubber is obtained from several species in Africa, India, and South America. The family furnishes woods that are used for carving and furniture, several fiber-plants, barks valuable in medicine, and some edible fruits. It includes the ordeal-tree of Madagascar (*Tanghinia venenifera*), the milk-tree of Demerara, the cream-fruit of Sierra Leone, and the periwinkle (*Vinca*), oleander (*Nerium Oleander*), star jasmine (*Trachelospermum*), and plants of the genus *Allamanda* which are cultivated in gardens and greenhouses.

The common name of the latter is *Indian hemp*, from the use of its fibrous bark by the American Indians for making nets.

apod, apode (ap′od, -ōd), *a.* and *n.* [< NL. *apus* (*apod-*), < Gr. *ἄπους* (*ἀποδ-*), footless, < *ἀ-* priv. + *ποίς* (*ποδ-*) = E. *foot*.] **I.** *a.* Footless; apodal.

II. *n.* An apodal or apodous animal; an animal without feet, or supposed to have none; a member of one of the several groups called *Apoda* or *Apodes*.

(*a*) As used by Aristotle, the third division of *Zoötoka*, or air-breathing animals which bring forth their young alive. It included the whales. This probably original use of the word still lingers in some systems. See (*b*). (*b*) Those placental mammals which have no feet, as distinguished from the *Pedota* (which see). (*c*) In *ichth.*, same as *Apodes*. (*d*) In Cuvier's system of classification, the second order of echinoderms, contrasted with *Pedicellata*. It is a heterogeneous group, consisting of the following genera: *Molpadia*, *Minyas*, *Priapulus*, *Lithodermis*, *Siphunculus*, *Bonellia*, *Thalassema*; which are now distributed among several phyla. (*e*) With Van der Hoeven, an order of echinoderms. See *Gephyrea*. (*f*) In Claus's arrangement, an order of holothurians, containing the families *Synaptidæ* and *Molpadiidæ*, the last of which constitutes his suborder *Pneumonophora*. (*g*) In Macleay's system of classification, a division of *Annelida*, including those which have no feet or distinct head: opposed to *Polypoda*. It is divided into three groups, the *Lumbricina*, *Nemertina*, and *Hirudinea*, or the earthworms, nemerteans, and leeches. (*h*) An order of *Amphibia*, same as *Gymnophiona* or *Ophiomorpha*, constituted by the family *Cæciliidæ* alone. (*i*) A group of degraded parasitic cirripeds, having a vermiform body, a suctorial mouth, no thoracic or abdominal limbs (and consequently no cirri), and a rudimentary peduncle represented by two separate threads bearing the characteristic antenniform organs. There is but one genus, *Proteolepas* (which see).

apodema (a-pod′e-mä), *n.*; pl. *apodemata* (ap-ō-dem′a-tä). [NL., < Gr. *ἀπό*, from, off, + *δέμας*, body, frame.] A name given to the plates of chitin which pass inward from the integuments of crustaceans, and divide as well as support their internal organs. Also *apodeme*.

apodemal (a-pod′e-mal), *a.* Having the character of an apodema: as, an *apodemal* partition; an *apodemal* chamber. Also *apodematous*.

(*a*) In the classification of Linnæus (1758), a group of osseous fishes without ventral fins and comprising a heterogeneous assemblage of representatives of various modern orders. (*b*) In Bloch and Schneider's system (1801), some one of several orders of fishes, the name being repeated under several so-called classes which were distinguished by the number of fins. As thus used, the word was a descriptive rather than a distinctive term. (*c*) In Cuvier's system, a section of the malacopterygians, the name being applied adjectively to such forms as are destitute of ventral fins. The true eels, symbranchiate eels, *Gymnonoti*, typical *Ophidioidea*, and *Ammodytoidea* were referred to this group. (*d*) By various later writers the name was used as a distinctive ordinal name. By T. Müller the *Ophidioidea* and *Ammodytoidea* were eliminated. By Gill, in 1861, the order was restricted to the typical and symbranchiate eels, and later (1884) to the true eels, or teleost fishes with the intermaxillaries atrophied or lost, the supermaxillaries lateral, and the body anguilliform and destitute of ventral fins. These characters are correlated with various others which justify the isolation. The principal families are the *Anguillidæ*, *Ophichthyidæ*, and *Murænidæ*.

2. In De Blainville's system of classification, a division of his *Entomozoaria*; the apodal, as distinguished from the chætopod, entomozoans. It includes the leeches, and is approximately equivalent to the *Hirudinea* of modern naturalists, but contains many intestinal worms.

Demonstrative; incontestable because demonstrated or demonstrable; of the nature of necessary proof.

> The argumentation is from a similitude, therefore not *apodictick*, or of evident demonstration.
> *Dr. J. Robinson*, Eudoxa (1658), p. 23.

> There is one character which will be considered decisive, and that is the *apodictic* certainty belonging to mathematical conclusions.
> *G. H. Lewes*, Probs. of Life and Mind, I. i. § 202.

2. In *logic*, a term descriptive of a form of judgment in which the connection of subject and predicate is asserted to be necessary; asserting its own necessity. Thus, "Two spheres

whose centers are distant from each other by less than the sum of their radii *must* intersect" would be an *apodictic* judgment. Such judgments may be false. This use of the word appears to have originated with Kant.

II. *n.* The logical doctrine of demonstration and of science.

Apodictic, we may assume, is in like manner the formal study of what constitutes knowledge strictly so called, the nature of the principles on which knowledge rests, the special marks distinguishing it, and the method by which knowledge is framed.
R. Adamson, Encyc. Brit., XIV. 785.

apodictical, apodeictical (ap-ō-dik′ti-kal, -dīk′ti-kal), *a.* Same as *apodictic, apodeictic.*

apodictically, apodeictically (ap-ō-dik′ti-kal-i, -dīk′ti-kal-i), *adv.* 1. Demonstratively; so as to be evident beyond contradiction.

Kant's marvellous acuteness did not prevent his transcendental from being *apodeictically* resolved into absolute idealism. *Sir W. Hamilton.*

Apodictically, we should say, if *a* is the cause of *β*, then all A which possesses *a* possesses *β*; thus reasoning from cause to causatum. *R. Adamson*, Encyc. Brit., XIV. 789.

2. By, or in the manner of, an apodictic judgment. See *apodictic*, 2.

apodid (a-pod′id), *n.* A member of the family *Apodidæ.*

apodixis, apodeixis (ap-ō-dik′sis, -dīk′sis), *n.* [< L. *apodixis*, < Gr. *ἀπόδειξις*, demonstration, proof, < *ἀποδεικνύναι*, demonstrate: see *apodictic.*] Full demonstration; absolute proof.

This might taste of a desperate will, if he had not afterwards given an *apodixis*, in the battle, upon what platform he had projected and raised that hope.
Sir G. Buck, Hist. Rich. III., p. 60.

apodon (ap′ō-don), *n.* An improper form of *apodan.*

apodosis (a-pod′ō-sis), *n.* [L., < Gr. *ἀπόδοσις*, a giving back, return, answering clause, < *ἀποδιδόναι*, give back, < *ἀπό*, from, away, + *διδόναι*, give, = L. *dare*, give. Cf. *dose.*] 1. In *gram.*, the concluding part of a conditional sentence; the consequent which results from or is dependent on the protasis, or condition; the conclusion. Thus, in the sentence, If it rains, I shall not go, the first clause is the *protasis*, the second the *apodosis.* When the protasis is introduced by such conditional conjunctions as *notwithstanding, though, although*, the apodosis predicates something opposite to what might have been looked for: as, Although we were few in numbers (*protasis*), we overthrew the enemy (*apodosis*). By some grammarians the term is not restricted to conditional sentences, but is extended to others similarly constructed: thus, in a simile the apodosis is the application or latter part.

2. In the *Gr. Ch.*, the last day of a church festival when prolonged throughout several days. It is sometimes coincident with or later than the octave, but generally earlier.

apodous (ap′ō-dus), *a.* [< *apod* + *-ous.*] Footless; apodal.

apogamic (ap-ō-gam′ik), *a.* Same as *apogamous.*

★**apogamous** (a-pog′a-mus), *a.* [< NL. *apogamus*, < Gr. *ἀπό*, away from, + *γάμος*, marriage.] In *bot.*, of the nature of or characterized by apogamy.

De Bary thinks that in forms where oögonia are found without male pollinodia they must be considered as representing a distinct *apogamous* species.
Smithsonian Rep., 1881, p. 403.

apogamously (a-pog′a-mus-li), *adv.* In an apogamous manner; by apogamy.

Those [spores] which are formed probably or actually without a sexual process — in a word, *apogamously* — but which may be considered . . . to be homologous with those which are actually sexually produced.
Encyc. Brit., XX. 431.

★**apogamy** (a-pog′a-mi), *n.* [< NL. *apogamia*, < *apogamus*: see *apogamous.*] In *bot.*: (*a*) Generally, the absence of sexual reproductive power, the plant perpetuating itself only by vegetative means, as buds, bulbs, etc. (*b*) In the higher cryptogams, the immediate development of the perfect plant from the prothallus without the usual intervention of sexual organs.

apogean (ap-ō-jē′an), *a.* [As *apogee* + *-an.*] Pertaining to or connected with the apogee: as, *apogean* (neap) tides, which occur when the moon has passed her apogee. Also *apogeic.*

apogee (ap′ō-jē), *n.* [< ML. NL. *apogæum, apogēum, apogæon, apogeon*, < Gr. *ἀπόγαιον, ἀπόγειον* (sc. *διάστημα*, distance), a planet's greatest distance from the earth, neut. of *ἀπόγαιος, ἀπόγειος*, from the land, from the earth (> L. *apogeus*, from the land), < *ἀπό*, from, + *γῆ*, poet. *γαῖα*, earth, land: see *geography*, etc.] 1. That point in the orbit of a planet or other heavenly body which is at the greatest distance from the earth; especially, that particular point of the moon's orbit. The ancients regarded the earth as fixed in the center of the universe, and accordingly assigned to the sun, with the planets, an apogee; but now that the sun is recognized as the center of our system, the terms *perihelion* and *aphelion* are employed to denote the least and greatest distance of the planets from that orb. Strictly, therefore, the sun is in its apogee when the earth is in its aphelion. In the Ptolemaic astronomy, the *mean* apogee of the epicycle is the point of the epicycle furthest from the center of the equant; the *true* apogee of the epicycle is that point of it furthest from the earth; and the *fixed* apogee of the epicycle is that point of it furthest from the center of the eccentric.

2. Figuratively, the highest or most distant point; climax; culmination.

In art he was represented in the full majesty of youthful manhood, in most of his attributions unclothed or but lightly draped, and usually characterized by the bow and arrows, the laurel, the lyre, the oracular tripod, the serpent, or the dol-

=**Syn. 2.** *Apology, Excuse, Plea.* *Apology* has in this sense the force of an admission that one has been, at least seemingly, in the wrong; it therefore pleads any extenuating circumstances, or, more often, offers a frank acknowledgment as the best that can be done toward making matters right. *Excuse* may mean a defense, or an explanation simply: as, his *excuse* was quite sufficient; or it may be a mere attempt at justification: as, it was only an *excuse;* or it may be a begging to be released from a claim: as, "they all with one consent began to make *excuse,*" Luke xiv. 18. A *plea* consists, according to the occasion, of an appeal for leniency, or of justificatory or exculpatory argument or persuasion.

Our English Martyrologer counted it a sufficient *apology* for what meanness might be found in the first edition of his "Acts and Monuments," that it was "hastily rashed up in about fourteen months."

In modern usage an appeal implies not merely a preliminary objection, but a proceeding for review after a decision has been rendered. As now used, it is a proceeding derived from the courts of equity. The mode of review at common law was formerly not to remove the cause, but only to bring up specific points or questions by writs of error. This was changed in England by the judicature acts of 1873–5, and there is now one Court of Appeal for all cases. In Scotland the highest appellate court is the Court of Session. The judgments of both these courts may be appealed to the House of Lords. In the United States the appeal has been to a great extent substituted for the writ of error. The highest appellate courts are, for federal questions arising in either federal or State courts, the United States Supreme Court; for other questions, the supreme courts, courts of appeal, or courts of error of the various States, the practice being wholly regulated by statutes. (*c*) The mode of procedure by which such removal is effected. (*d*) The right of removal to a higher court. (*e*) Formerly, a vindictive action at the suit of a party injured when the supposed criminal had been previously acquitted on an indictment or pardoned. To *prize* is to value highly, generally for other than pecuniary reasons, and suggesting the notion of reluctance to lose. Thus, we *prize* a book for its contents or associations; we *prize* a friend for his affection for us. To *esteem* is sometimes simply to think: as, I *esteem* him a scoundrel; sometimes to value: as, I *esteem* it lightly; sometimes to have a high opinion of or set a high value on: as, I *esteem* him for his own sake; in its highest sense it implies moral approbation. *Estimating* is an act of computation or judgment, and wholly without feeling or moral approbation: as, to *estimate* the size of a room, the weight of a stone, the literary excellence of a book, the character of a person. (See *esteem*, *n.*, for comparison of corresponding nouns.) *Appreciate* is to set a just value on; it implies the use of wise judgment or delicate perception: as, he *appreciated* the quality of the work. With this perception naturally goes a corresponding intellectual valuation and moral esteem: as, they knew how to *appreciate* his worth. *Appreciate* often implies also that the thing appreciated is likely to be overlooked or underestimated. It is commonly used of good things: as, I *understood* his wickedness; I *realized* or *recognized* his folly; I *appreciated* his virtue or wisdom. Compare such phrases as an *appreciative* audience, a few *appreciative* words, *appreciation* of merit.

pubescent, orange-colored fruit, of a rich aromatic flavor, the produce of a tree of the plum kind, *Prunus Armeniaca*, family *Amygdalaceæ.* Its specific name is due to the belief that it is a native of Armenia, but it is now supposed to be of Chinese origin.

It grows wild in the Himalayas and Northwestern Provinces of India, where its fruit is gathered in great quantities. It was introduced into England in 1524, by the gardener of Henry VIII. The tree rises to the height of from 15 to 20 and even 30 feet, and its flowers appear before its leaves. In cultivation it is often propagated by budding upon plum-stocks. a priori (ā prī-ō′rī). [L., from something prior or going before: *ā* for *ab,* from; *priori,* abl. of *prior,* neut. *prius,* preceding: see *prior, a.*] From the former; from that which precedes; hence, from antecedent to consequent, from condition to conditioned, or from cause to effect. Since the fourteenth century, the phrase *demonstratio a priori* (first found in Albert of Saxony, died 1390) has been commonly employed, instead of the earlier expression *demonstratio propter quid,* to mean proof proceeding from causes or first principles: opposed to *demonstratio a posteriori,* or *demonstratio quia,* which proceeds from effect to cause, and simply proves the fact without showing why it must be as it is. In the eighteenth century *demonstratio a priori* was applied to reasoning from a given notion to the conditions which such notion involves. But since Kant, *a priori,* used as an adjective and frequently placed before the noun, has been applied to cognitions which, though they may come to us in experience, have their origin in the nature of the mind, and are independent of experience.

Demonstration is perfect, when it proceedeth from the proper cause to the effect, called of the scholemen, *à priore.* *Blundeville,* Arte of Logicke (1599), vi. 19.

Thus when we argue from the ideas we have of immensity, eternity, necessary existence, and the like, that such perfections can reside but in one being, and thence conclude that there can be but one supreme God, . . . this is an argument *a priori.* *Clarke.*

General truths, which at the same time bear the character of an inward necessity, must be independent of experience—clear and certain by themselves. They are therefore called *a priori,* while that which is simply taken from experience is said to be, in ordinary parlance, known a posteriori or empirically only.
Kant, Critique of Pure Reason, tr. by Max Müller.

As used in a psychological sense, knowledge a posteriori is a synonym for knowledge empirical, or from experience; and, consequently, is adventitious to the mind, as subsequent to, and in consequence of, the exercise of its faculties of observation. Knowledge *a priori,* on the contrary, called likewise native, pure, or transcendental knowledge, embraces those principles which, as the condition of the exercise of its faculties of observation and thought, are, consequently, not the result of that exercise. True it is that, chronologically considered, our *a priori* is not antecedent to our a posteriori knowledge; for the internal conditions of experience can only operate when an object of experience has been presented. *Sir W. Hamilton.*

sanctuary of any church, particularly if it presents a superficial resemblance to an apse in the stricter sense, in that it is at least approximately semicircular in plan, and vaulted: commonly equivalent to *chevet,* and applied to the altar extremity of a church, even if of rectangular plan and not vaulted, and including the apse-aisles, chapels, and any other adjunct to the ritual east end of a church. The apse in its origin was a characteristic feature of the ancient Roman basilica, in which it formed the raised tribune for the court magistrates. The throne of the quæstor or presiding judge stood in the center of the chord of the arc of the apse. When the basilicas became Christian churches, the throne was replaced by the high altar, which still occupies this position in Latin churches of the strict basilica type, and has regularly kept it in Oriental churches. (*b*) An apse-chapel.—**Apsidal surface,** in *math.*, a surface related to any other surface and to any point as Fresnel's wave-surface is related to the quadric surface and to its center; that is to say, on each plane section of an original surface through a certain fixed point the radii from that point which cut the section orthogonally are taken, and distances equal to these radii are measured off from the fixed point on the perpendicular to the section; then the locus of the extremities of these lines so measured is the apsidal surface.
